ABSTRACT

This study investigated the relationship between social phobia, peer attachment, and identity development, within three different countries: China, India, and the USA. It was hypothesized that social phobia interferes with peer attachment, and that poor peer attachment interferes with identity development among late adolescents and emerging adults, thus peer attachment mediates the relationship between social phobia and identity. It was further hypothesized that this relationship between variables is moderated by culture such that in collectivistic cultures, where identity is more dependent upon group affiliation and identification, the interference of social phobia (through peer attachment) on identity would be much greater than in individualistic cultures where identity may be based more on unique characteristics. Participants were 422 undergraduate students from three locations: China ($n = 180$), India ($n = 96$), and the USA ($n = 146$). Results varied by country. For the combined sample collectivism, social phobia, and peer attachment each independently predicted identity. Collectivism also negatively predicted social phobia and positively predicted peer attachment. None of the variables served as a mediator or moderator between the other variables. In the USA sample, collectivism predicted identity but was mediated by peer attachment. Social phobia negatively predicted peer attachment and identity, but was not related to collectivism. In the Chinese sample, peer attachment predicted identity, but was mediated by social phobia. Collectivism predicted identity, but was not related to the other two variables. Among the Indian sample none of the variables predicted identity. A number of possible reasons for these complex results are explored.

To my parents Ailing and Ximin, who gave me unconditional love and support whole-heartedly.

To my friends Ting and Afeng and my teachers Na and Jing, who offered me significant help
throughout this journey.

ACKNOWLEDGMENTS

I would like to thank my major advisor Dr. Steven Berman for his careful guidance, patience, and deep consideration through the whole course of this study.

I would like to express my deep appreciation for Dr. Edward Fouty and Dr. Jane Compson for being on my thesis committee.

CHAPTER ONE: INTRODUCTION

This study investigates the relationship between social phobia, peer conflict, and identity development, within three different countries: China, India, and the USA. It was hypothesized that social phobia interferes with peer attachment, and that poor peer attachment interferes with identity development among late adolescents and emerging adults, thus peer attachment mediates the relationship between social phobia and identity. Although quite limited, there exists some research to document the link between social phobia and peer attachment (e.g., Festa & Ginsburg, 2011) and between peer attachment and identity (e.g., Johnson, et al., 2007), as well as social phobia and identity (Gultekin & Dereboy, 2011). This study also expanded upon the current literature by investigating whether these relationships are moderated by culture. It is proposed in this study that in collectivistic cultures, where identity is more dependent upon group affiliation and identification, the interference of social phobia (through peer attachment) on identity is much greater than in individualistic cultures where identity may be based more on unique characteristics.

The proposed relationship between variables can be seen in figure 1. As this is the first known study to examine all these variables in combination, the research considering aspects of this model will be reviewed, taking two variables at a time.

Peer Attachment and Identity Development

According to Sullivan (1953), the development of emotional closeness and intimacy is an important landmark for adolescents' development of identity. Erikson (1968), on the other hand, argued that the development of a strong sense of identity is necessarily precursory to the development of emotional closeness and intimacy. Although their arguments appear to be

contradictory with regard to the developmental roles of emotional closeness, intimacy, and identity, they both agree that the development and integration of relationship closeness, intimacy, and identity is characterizing the later period of adolescence, which is the emerging adulthood. Researcher further found that this integrating relationship between identity and relationship closeness further leads to a circular relationship among these factors (Johnson, et al., 2007).

According to Dyke and Adams (1987), as relationships become closer, individuals start learning more about themselves through the relationships. This learning process helps the individuals develop increased closeness in the relationship, which promotes further development of identity (McLean & Thome, 2003). Although these researchers did not separate friendship closeness from romantic closeness, the current study focuses on friendship closeness and intimacy (i.e., peer attachment) instead of romantic intimacy.

Erikson's (1968) psychosocial theory indicates that during the late adolescent period, individuals are facing the intimacy against isolation crisis, while the task of forming intimate relationships is complicated by other competing developmental tasks in reality. Most individuals during this period not only manage to prepare for intimate relationships, but also try to establish secure identities (Erikson, 1968), maintain other close relationships such as friendships (Hartup & Stevens, 1997), and gradually form adult roles in society (Havighurst, 1948).

Johnson, et al. (2007) found that emotional closeness within same-sex friendships was positively associated specifically with friendship identity commitment, whereas closeness within cross-sex friendships was associated with more general overall identity commitment. Barry, Madsen, Nelson, Carroll, and Badger (2009), on the other hand, found that identity achievement was positively associated with several qualities of romantic relationships, but was not associated

with any of their measured friendship qualities. The authors concluded that as individuals fulfill their adult roles and responsibilities, they also experience a developmental need. This developmental need requires a shifting of the individuals' focus from friendships to romantic relationships, which also impacts qualities of these relationships. While young people become more established in the adult world, they become less invested in friendships and more invested in romantic relationships. Thus, friendship quality may play a role in the development of identity, but becomes less important to people as they consolidate their identity and move on to the Eriksonian stage of intimacy.

Social Phobia and Peer Attachment

Social anxiety has been utilized as a general term to describe shy, withdrawn, and inhibited individuals experiencing anxiety when faced with social or performance demands (Greco, 2004). According to the American Psychiatric Association (APA, 1994, p. 416), social anxiety is the hallmark feature of social phobia, a chronic and debilitating condition involving “a marked and persistent fear of one or more social or performance situations in which the person is exposed to unfamiliar people or to possible scrutiny by others”. Social anxiety has been recognized as an important factor for us to understand adults' interpersonal behavior and psychological functioning (Watson & Friend, 1969).

La Greca and Lopez (1997) had an observation that for those adolescents who reported higher levels of social anxiety, there was less acceptance and support by their peers and less romantic attractiveness to others. Although the associations were stronger for girls, these associations were noticeable for both boys and girls. They also found that socially anxious girls reported having fewer best friends than girls who were less socially anxious. These friendships

appeared to be lower in intimacy, companionship, and emotional support. On the other hand, although in the boy's close relationships generalized social avoidance and distress was related to less perceived support and competency, social anxiety was not typically associated with friendship qualities for boys (La Greca & Lopez, 1997).

Given the cross-sectional nature of La Greca and Lopez (1997)'s investigation, it was not possible to determine whether it was the feelings of social anxiety led to poor peer relations among adolescents, or whether it was the poor peer relations led to feelings of social anxiety. Nevertheless, it is confirmed that being neglected by the peers or excluded from peer interactions is a significant stressor for adolescents (Frankel, 1990), and it could also cause feelings of social fear, worry, or distress (Leary, 1990). These subjective feelings may conversely lead the individuals to behavioral avoidance of peers and miss opportunities for normal socialization experiences (La Greca & Lopez, 1997).

Parade, Leerkes, and Blankson (2010) found that social anxiety and ease in forming friendships were negatively associated. The negative association was also true between social anxiety and satisfaction in friendships, for both minority and white students. This supported their view that social anxiety may negatively impact students' confidence and willingness to introduce themselves to unknown peers, as well as contribute to difficulties for them to engage with their peers appropriately. Furthermore, the researchers found that there may be more negativities in the evaluation of their relationships from students with heightened social anxiety than students who do not experience social anxiety.

Festa and Ginsburg (2011) found that friendship quality was associated with lower social anxiety (as rated by an independent evaluator), specifically the validation from friends being one

aspect of the friendship quality. Children are less likely to experience social anxiety symptoms if they have friends who offer positive comments for their ideas, tell them they are good at doing things, and make them feel significant and special.

It seems obvious that social anxiety has a negative impact on friendship; however, it raises the question as to how socially anxious individuals even develop friendships. Zalk, Zalk, Kerr, and Stattin (2011) investigated patterns of how socially anxious youth would choose their friends. They found that youths with social anxiety selected friends who were similar to themselves, and friends' social anxiety influenced their social anxiety over time. These findings supported the researchers' suggestion that these youth and their close friends might influence each other's social anxiety through their ordinary daily interactions.

Scharfstein, Alfano, Beidel, and Wong (2011) explored the impact of different types of anxieties on friendship. They found that children with Generalized Anxiety Disorder and Social Phobia both have fewer friends than Healthy Control children, but were just as likely to have a best friend. However, compared to the other two groups, youth with Social Phobia were experiencing significant difficulty making new friends based on the parents' report. Youth with Social Phobia were also rated as less socially competent than Healthy Control children. In contrast, youth with Generalized Anxiety Disorder did not differ from the Healthy Control group in terms of the quality of their peer interactions, the frequency of contact with friends, and the ability to make new friends.

In an attempt to explore in greater depth which aspects of friendship are affected by social anxiety, Vernberg, Abwender, Ewell, and Beery (1992) found that social anxiety influences adolescents' emergence of companionship and intimacy in their newly formed

friendships, but was not related to direct aggression or exclusion from peers. They further found that difficulties acting relaxed in new settings and with unfamiliar peers is actually less problematic than difficulties acting relaxed with familiar peers, which interferes with friendship development by limiting interaction and decreasing peer intimacy.

Schneider (2009) studied socially withdrawn, anxious participants and control participants to observe and compare their interactions with their friends. He found that the socially anxious participants were very reticent in their interaction with close friends, having relatively little to say. They were also unassertive, displayed little positive affect and a lack of competitiveness. Schneider and Tessier (2007) found that the socially withdrawn, anxious early adolescents tend to have much less mature understanding of best friendship than their non-anxious peers. Their socially withdrawn anxious group displayed friendship reasoning with a focus on their own needs without consideration to the needs of the friends'. They further found that many of the specific needs that are evident in the thinking of the socially withdrawn anxious participants are the most concrete needs, such as receiving help from their friends.

Social Phobia and Identity Development

According to Erikson (1968), identity formation in early adolescence has been described as the beginning of an exploration. This exploration was not possibly occurring earlier due to the limited cognitive capacities and the narrower social context that typically characterizes younger children's life experience. Adolescents' development of identity is also described as being formed with inherent confusion, even a sense of loss when the adolescent diverts from what was already known about childhood and strives for unknown challenges ahead. There are concerns with regard to adolescents' experiencing social acceptance and being left behind. It is especially

essential as adolescents experience a period, in which an emerging differentiation of interests, needs, and attitudes from the unexamined values of childhood is evolving. The process of individuation is characterized by psychological conflict, which further consequent with anxiety (Erikson, 1968; Kroger, 1995). Identity theorists have proposed many developmental and contextual factors that influence identity formation in adolescence, being cognitive capacities, egocentrism, psychopathology, family relations, peer relations, religiosity, ethnic group membership, and the broader community (Markstrom-Adams, 1992).

One study was found that directly examined the relationship between identity development and social phobia. Gultekin and Dereboy (2011) conducted a study with college students, and they found that those students who have social phobia, especially generalized social phobia, experienced identity conflicts more often than those students who do not have social phobia. Additionally, students with generalized social phobia experienced more conflicts during identity formation than those who have a specific social phobia. It is the contention put forth in this thesis that it is social phobia's effect on peer attachment that indirectly affects identity development. However, it is further hypothesized that this relationship can be intensified or attenuated depending on one's cultural orientation.

Cultural Considerations

There are many psychological processes which vary profoundly within and across cultures. For example, there are self-construal, attribution, holistic versus analytic thought, intrinsic and extrinsic motivation, locus of control, cognitive consistency, moral judgment, and other processes (Fiske, Kitayama, Markus, & Nisbett, 1998). Cohen (2009) stated that it is

essential to understand culture before we try to understand behavior in business contexts, schools, families, friendships, and even responses to strangers in crowded urban contexts.

According to Triandis (1989), the self is composed of three aspects, which are private, public, and collective. There are also three dimensions of cultural variation linked to each of the selves, which are individualism-collectivism, tight-loose cultures, and culture complexity. The aspects are differentially sampled in various cultures, depending on the three dimensions. In a more complex, individualistic, and loose culture, people are more likely to sample the private self and are less likely to sample the collective self. It is more likely for people to be influenced by the norms, role definitions, and values of the particular collective when people sample the collective self than when they do not sample the collective self.

Allocentric individuals tend to define themselves in terms of in-group relationships and know more about others than themselves. On the other hand, idiocentric individuals see the individual as the basic unit of social perception. The self is defined as a separate identity, and these individuals know more about themselves than others. They favor beliefs that reflect independence and emotional detachment from in-group relationships (Bhugra, 2005).

Oyserman, Coon, and Kemmelmeier (2002) stated that there are four plausible consequences of individualism, which are self-concept, well-being, attribution style, and relationality. When it comes to self-concept, creating and maintaining a positive sense of self is a basic human endeavor within the realm of individualism (Baumeister, 1998). In contrast, group membership is a central aspect of identity in collectivism (Hofstede, 1980; Hsu, 1983; Kim, 1994; Markus & Kitayama, 1991). For well-being, individualism indicates that openly express one's emotion and achieve one's personal goals are important sources of well-being (Diener & Diener,

1995; Markus & Kitayama, 1991). On the other hand, collectivism implies that life satisfaction derives from restraint in emotional expression, successfully fulfilling social roles and obligations and avoiding failures in these domains (Kim, 1994; Kwan & Singelis, 1998; Markus & Kitayama, 1991). Regarding attribution style, individualism promotes a decontextualized reasoning style, which means that social information is separated from social context (Oyserman, Coon, & Kimmelmeier, 2002); however, collectivism suggests that social context, situational constraints, and social roles have significant impact on personal perception and causal reasoning (Miller, 1984; Morris & Peng, 1994). With regard to relationality, individualism indicates that the relationships and group memberships are for individuals to attain self-relevant goals, but the relationships and group membership are not permanent or intensive (Kagitcibasi, 1997; Oyserman, 1993). Collectivism indicates that important group memberships are fixed that people must accommodate to them. There are certain boundaries between in-group relationships and out-group relationships, and they are stable, relatively impermeable, and important (Kim, 1994; Morris & Leung, 2000; Sayle, 1998; Triandis, 1995).

Identity Development and Culture

Several researchers have been focused on the relationship between identity development and culture. For instance, Triandis (1995) further defined individualism and collectivism at the individual level as idiocentric and allocentric. Idiocentric refers to individuals who seek personal gains and interests. Allocentric defines individuals who see their interests and goals as aligned with the group's interests and goals. The source of a member's identity dictates the person's individualist or collectivist inclination. An individual's identity that is defined by personal attributes and a self-concept is illustrative of individualists, while an identity developed from a

collective identity and defined by group membership is descriptive of collectivists (Khoury, 2006).

In a cross-national study of identity development, Berman, You, Schwartz, Teo, and Mochizuki (2011) found that their Asian sample scored significantly lower than their American sample on both identity commitment and identity distress. Americans and Japanese scored significantly higher than the Chinese and the Taiwanese on both identity commitment and identity distress. It is possible that self-identity in collective Asian cultures is not formed through a process that entails crisis, exploration, self-discovery, and commitment to a great extent. Instead, individual identity is understood as being part of the collective culture (Markus, & Kitayama, 1991), which may result in lower levels of distress and commitment compared to Americans. Thus, to explore and seek out a personal sense of identity may be the normal path of identity development in Western industrialized mainstream society, while in Asian societies, to seek out one's sense of identity, which also has more interpersonal significance, from group membership (e.g., family, community, country) (Cross, Gore, & Morris, 2003) may be considered as normal.

Cultural norms play a very important role in the process of identity development through peer interaction, evaluation and reaction process. According to Chen (2012), culture influences individual development such that children maintain or modify their behaviors during peer interactions in accord with culturally directed social evaluation. For instance, children in North America who are shy would receive negative peer feedback which creates pressure on these children. Hence these children might alter their behavior in order to improve their peer status (Rubin, Coplan, Fox, & Calkins, 1995). On the other hand, children in China who are shy are

often informed that their wary and restrained behaviors are acceptable and appreciated (Chen, DeSouza, Chen, & Wang, 2006). Thus, these positive experiences help these children display their competence in different areas (Chen, Chen, Li, & Wang, 2009).

Peer Attachment and Culture

There are many studies in regard to peer relationships in different cultures in the field of psychology. Gummerum and Keller (2008) found a clear developmental trend for content categories that are associated with the internal–psychological functions of friendship, examples being positive feelings, communication, and trust. They also observed distinct cross-cultural differences for these content categories, which is in accordance with previous cross-cultural research on how differently friendships are conceptualized in Asian and western societies, as well as relationships in general (Goodwin & Lee, 1994; Kon & Losenkov, 1978; Schneider, Smith, Poisson, & Kwan, 1997; Triandis, 1995).

Gummerum and Keller (2008) indicated that in China and Russia, there is a strong emphasis put on mutual responsibility and emotional dependence between individuals. This is especially salient between members of one’s in-group relationships, with friendship being a part. Children in China and Russia might be instilled with cultural concepts that emphasize the psychological functions of friendship (e.g., the concept of heart-to-heart friendship in China). Gummerum and Keller (2008) stated that with the notion of heart-to-heart friendship, the Chinese culture offers children a concept that emphasizes the psychological and intimate aspects of friendship, and children are encouraged to develop intimate, caring, and helpful relationships with each other. Different school and educational arrangements (e.g., after-school activities in the community) manage to create social settings and opportunities that encourage particular

forms of friendship interaction, which were mentioned earlier. These educational settings also help children understand what a close, intimate friendship should be like. In contrast, western children may primarily develop a perception of good friendships based on their social experience in peer interaction and from reading. Therefore western children may construct the concept of friendship with others through the process rather than learn it directly as a cultural concept (Keller, 2004; Krappmann, Uhlendorff, & Oswald, 1999; Youniss, 1980). These studies suggest that peer attachment may be a more intimate relationship in eastern culture than it is in western culture.

It is important to note that cultural differences are likely to exist in the meaning of friendship, and these differences would reflect cultural understanding of the qualities of ideal relationships (Krappmann, 1996). Some researchers have pointed out that there is need for modification of the existing model of friendship in regard to individualistic and collectivistic culture. French, Bae, Pidada, and Lee (2006) found that South Korean students reported more disclosure and more exclusivity in their interactions with friends than US students. On the other hand, French, Pidada, and Victor (2005) found that Indonesian college students interacted more with different people, somewhat less close, and more inclusive than those of U.S. students, which seems to be in contrast to suggestions that collectivists develop closer relationships than individualists. Thus, French, Pidada, and Victor (2005) suggested that closeness of friends and restriction of interaction to small groups of insiders is consistent with some collectivist cultures but not all of them, and there are no consistent patterns of friendship interaction, which would universally exemplify those in collectivist cultures.

Social Phobia and Culture

It is important to also consider the potential differences in the concept of social phobia within a larger cultural context. Cross (1995) found that among a sample of East Asian students during their first year of graduate study in the U.S., there was association between independent self-construal and greater use of coping strategies. Further, the greater use of coping strategies was found related to lower reported stress. In contrast, East Asian students who scored higher on interdependent self-construal experienced greater stresses. Interestingly, there was no self-construal/stress relationship found among the domestic U.S. students. (Kleinknecht, Dinnel, Kleinknecht, Hiruma, & Harada, 1997).

Park, Sulaiman, Schwartz, Kim, and Ham (2011) also found that among Asian college students, a positive association was found between an interdependent self-construal and emotion suppression, and the emotion suppression was positively associated with social anxiety. On the other hand, a negative association was found between an independent self-construal and social anxiety, and social anxiety was also negatively associated with suppression. An interdependent self-construal is when relationships with others are seen central to one's identity. This study indicated that emotion suppression was one essential mechanism that causes these Asian students to experience higher level of anxiety.

Some researchers investigated the possible reasons why individuals from collectivistic cultures tend to experience social anxiety. According to Xie, Leong, and Feng (2008), self-oriented perfectionism (i.e., high self-standards of performance) is a better predictor of social anxiety for Caucasians, whereas socially prescribed perfectionism (i.e., high social standards of performance) better predicts social anxiety for Asians. Additionally, Lau, Fang, Wang, and Kang

(2009) found that higher social anxiety among Asians could be explained by cultural differences in accordance with the emotional states of others. Asians are cultivated to care about accurately perceiving other's emotional responses, however, they have limited competencies in emotional recognition due to the norms governing emotional control at the same time. Hence, these individuals may find themselves in a double bind that leads to social unease due to the fact that there is a cultural emphasis on sensitivity to others' emotions without being able to develop this attunement skill set.

However, there is some contrary research which shows the opposite findings. Maercker (2001) investigated the association of cultural values of some specific cultures with the prevalence of disorders such as depression and anxiety. The researcher found that there was a negative relation between the two disorders and the traditional values. There was also a negative relation between the prevalence of generalized anxiety and conservatism and preference for hierarchy. Conservatism is defined as relying on social control by the group members, and preference for hierarchy is defined as appreciation of privileged other persons along with the privileges. Additionally, according to Bhugra (2005), allocentric persons tend to have happy marriages and are more likely to receive social support which could counteract the life change stresses.

Instead of directly pointing out the positive/negative correlation between culture and social anxiety, Hofmann, Asnaani, and Hinton (2010) stated that the key mechanisms which produce Social Anxiety Disorder were shown to be influenced by culture. They suggested that some of the mechanisms include individualism/collectivism, perception of social norms, self-construal, and gender role and gender role identification.

Hsu, et al. (2012) investigated the accuracy of the stereotype that people of East Asian Heritage experience more social anxiety than people of Western Heritage. In opposition to the idea that higher levels of social anxiety in East Asian Heritage individuals are associated with greater exposure to East Asian cultural values, the results suggested that elevated social anxiety among East Asian Heritage individuals reflected stress related to the bicultural experience, based on the finding that Canadian residents of East Asian Heritage reported higher social anxiety as compared to the unicultural samples (Western-heritage Canadians and native Koreans and Chinese). This research indicated that a collectivistic cultural value itself does not necessarily lead to social anxiety. Instead, some other dimensions, such as individuals' experience, should be considered when we want to understand the relationship between cultural value and social anxiety.

Another interesting study also suggested that collectivistic values per se do not explain the differences in social anxiety across cultures (Schreier, et al., 2010). This study showed that their Latin American group displayed the lowest social anxiety level within three country samples (East Asian countries, Latin American countries, and European and North American countries) whereas the collectivistic East Asian group displayed the highest social anxiety level. These results were also in agreement with the results by Arrindell et al., (2005) which found that social anxiety is unrelated to country levels of individualism.

These studies indicate that social anxiety is a culturally influenced factor. In this research, it is not assumed whether people from individualistic cultures tend to have more or less social phobia than people from collectivistic cultures. Instead, it is suggested that culture has a moderating effect on the relationship between social phobia, peer attachment, and identity, such

that in cultures where identity is more collectivistically defined, social anxiety is likely to have a greater effect on identity (through the mediating effect of peer attachment,), than it will in cultures where identity is more individually defined.

Rationale and Hypotheses

Based on Erikson's (1968) theory and Johnson, et al.'s (2007) finding that peer attachment is very important for identity development, and other research (La Greca & Lopez 1997; Parade, Leerkes & Blankson, 2010) which suggests that that social phobia interferes with peer attachment, it is hypothesized that peer attachment will mediate the relationship between social phobia and identity development among late adolescent and emerging adult college students. It was further hypothesized that cultural orientation will moderate this relationship such that social phobia will have a stronger negative impact on identity development among those who endorse more collectivistic values.

CHAPTER TWO: METHODS

Participants

A total of 422 undergraduate students ($M = 20.80$, $S = 3.64$) were recruited from two urban colleges in Beijing and Xi'an, China ($n = 180$), one urban college in Delhi, India ($n = 96$), and one urban college in Orlando, USA ($n = 146$). The USA sample was 84.9% female with a mean age of 20.51 and standard deviation of 5.61. The racial/ethnic breakdown included 66.4% White/Caucasian (non- Hispanic), 15.8% Hispanic, 7.5% Black (non- Hispanic), 5.5% Mixed ethnicity, 4.1% Asian, and 0.7% other. The Indian sample was 47.7% female with a mean age of 22.04 and standard deviation of 1.71. The Chinese was 53.6% female with a mean age of 20.42 and standard deviation of 1.65.

Measures

Demographic Questionnaire

A demographic questionnaire developed for this study was used to assess age, gender, grade, and marital status.

Inventory of Parent and Peer Attachment—Peer Subscale (IPPA)

The IPPA (Armsden & Greenberg, 1987) was developed to measure attachment in older adolescents. It assesses the positive and negative affective and cognitive dimensions of adolescents' relationships with their parents and close friends. For this study, only the peer attachment scales were used. For each of the 25 items assessing peer attachment, respondents are required to rate the degree to which each item is true for them on a five-point Likert scale ranging from 'Almost always or always true' to 'Almost never or never true'. The items in each of the scales were demonstrated through principal components analysis to cluster into three

factors: trust, communication, and alienation. Armsden and Greenberg (1987) reported good internal consistency for the IPPA with Cronbach's alpha coefficients ranging between .72 and .91 for the sub-scales across both the parent and peer scales. They formed a composite score by adding the total score from the trust and communication scales and then subtracting the total score from the alienation scale. Our results indicated a Cronbach's alpha coefficient of .89 for the trust subscale, .86 for the communication subscale, but only .40 for the alienation subscale. Further analyses determined that the alpha for the alienation scale was .72 for the USA sample, but .49 and .41 for the Chinese and Indian samples, respectively.

Social Phobia Scale (SPS)

The SPS (Mattick & Clarke, 1989) assesses anxiety in situations in which the individual may be observed by others (e.g., "I get nervous that people are staring at me as I walk down the street"). Respondents are instructed to rate each of the 20 statements on a five-point Likert scale as it applies to them (0 = not at all characteristic or true of me, 4 = extremely characteristic or true of me). Mattick and Clarke (1989) reported Cronbach's alphas from five samples ranging from .89-.94. Test-retest reliability exceeded .90 at intervals of up to 13 weeks. Construct validity was demonstrated by social phobics scoring higher on the SPS than normal groups or agoraphobics. Heimberg, Mueller, Holt, Hope, and Liebowitz (1992) provide additional evidence of the validity and reliability of the SPS. Our results indicated a Cronbach's alpha coefficient of .90.

Erikson Psycho-Social Index (EPSI)

The EPSI (Rosenthal, Gurney, & Moore, 1981) was used to assess intimacy and identity as dimensions of positive psychosocial functioning. The EPSI is a 72-item measure that includes

six subscales, each consisting of 12 items indicating how well respondents have resolved conflicts indicative of Erikson's (1968, 1982) first six stages of psychosocial development. For this study, only the Identity and Intimacy scales were used. Items are rated on a five-point Likert-type scale, ranging from *never true* (1) to *always true* (5). The subscales have demonstrated satisfactory construct validity and adequate alpha reliability coefficients (Rosenthal, Gurney, & Moore, 1981; Sandor & Rosenthal, 1986). The results indicated a Cronbach's alpha coefficient of 0.72 for the identity subscale and .72 for the intimacy subscale.

Cultural Orientation Scale (COS)

The COS (Triandis & Gelfand, 1998) measures beliefs and attitudes that express individualistic and collectivistic tendencies. It has a total of 27 items, each rated on a five-point Likert-type scale (1= strongly disagree, 5= strongly agree). Examples of the scale include items such as "*Being a unique individual is important to me*" and "*Winning is everything*". Triandis and Gelfand reported moderately good internal consistencies ranging from 0.60 to 0.68. The results indicated a Cronbach's alpha coefficient of .77 for the individualism subscale and .80 for the collectivism subscale.

Procedure

Following the translation guidelines proposed by Guillemin, Bombardies, and Beaton (1993), the measures given to the Chinese sample were translated from English into Chinese, and then translated back into English, by one who had not seen the original English measure. The two English copies were then reviewed to discuss and ameliorate the discrepancies. Because the language of instruction in the Indian University sampled was English, the participants from India completed the surveys in English.

Participants were provided with an IRB approved informed consent form before completing the survey battery. They were informed that this study surveyed their beliefs and feelings about their sense of self. The Chinese and Indian participants were provided with a paper and pencil based battery of measures while the USA participants received the battery of measures online.

CHAPTER THREE: RESULTS

Preliminary and Descriptive Analyses

A one-way analysis of variance (ANOVA) indicated that the three samples significantly differed in age $F(2, 412) = 6.81, p = .001$. A least squares difference post hoc analysis indicated that the Indian sample was significantly ($p = .001$) older ($M = 22.04, SD = 1.71$) than the Chinese ($M = 20.42, SD = 1.65$) and the American ($M = 20.51, SD = 5.61$) samples ($p = .002$). The Chinese and American samples were not significantly different in age distribution. The three samples were also significantly different in gender distribution ($\chi^2(2, N = 413) = 45.87, p < .001$) with 84.9% females in the USA sample compared to 53.6% females in the China sample and 47.7% females in the India sample.

The range (both possible and actual), mean and standard deviation for each of the study variables is presented in Table 1. A 2 x 3 (gender by country) Multivariate Analyses Of Variance (MANOVA) was conducted to compare the three samples on all measures (see Table 2). There was a significant main effect for gender (Wilks' $\Lambda = .89, F(5, 400) = 10.34, p < .001$) with males scoring higher on individualistic orientation ($F(1, 404) = 18.83, p < .001$), and females scoring higher on collectivistic orientation ($F(1, 404) = 8.70, p = .003$), identity ($F(1, 404) = 7.19, p = .008$), and peer attachment ($F(1, 404) = 8.06, p = .005$). There was also a significant main effect for country (Wilks' $\Lambda = .39, F(10, 800) = 48.81, p < .001$) in regard to collectivistic orientation ($F(2, 404) = 19.34, p < .001$), identity development ($F(2, 404) = 15.14, p < .001$), and peer attachment ($F(2, 404) = 237.17, p < .001$). In regard to collectivistic orientation, the Indian sample scored significantly higher than the American sample ($p = .036$), which scored significantly higher than the Chinese sample ($p < .001$). In regard to identity development, the

American sample scored significantly higher than the Chinese sample ($p < .001$), which scored significantly higher than the Indian sample ($p = .004$). In regard to peer attachment, the American sample scored significantly higher than the Chinese and Indian samples ($p < .001$), which were not significantly different from each other. There was also a significant interaction effect for gender by country (Wilks' $\Lambda = .88$, $F(10, 800) = 5.16$, $p < .001$) on individualistic orientation ($F(2, 404) = 9.44$, $p < .001$) and peer attachment ($F(2, 404) = 10.01$, $p < .001$). As can be seen in Figure 2, males scored much higher in individualistic orientation in both India and the USA, but there does not seem to be a large difference by gender in China. In regard to peer attachment, in Figure 3, it would appear that females scored higher than males in the USA but there is not a large gender difference in the Indian and Chinese samples.

A correlational coefficient matrix was constructed among all the study variables (see Table 3). As can be seen in this table, identity was significantly positively correlated with peer attachment ($r = .46$, $p < .001$) and collectivistic orientation ($r = .26$, $p < .001$), and negatively correlated with social phobia ($r = -.38$, $p < .001$). Collectivism was also negatively correlated with social phobia ($r = -.15$, $p = .002$) and positively correlated with peer attachment ($r = .140$, $p = .003$) and individualistic orientation ($r = .30$, $p < .001$).

Main Analyses

To test the hypothesis that social phobia predicts identity development, but peer attachment mediates this relationship, a series of multiple regression analyses were conducted. Following the procedure suggested by Holmbeck (1997), three regressions are needed to establish mediation. In the first regression, variable A (social phobia) must significantly predict

variable B (peer attachment). In the second regression, variable A (social phobia) must significantly predict variable C (identity). In the third regression both variables A (social phobia) and B (peer attachment) are entered on the same step to predict variable C (identity), but to prove mediation, variable A (social phobia) should be less highly associated with variable C (identity) than it was in the second regression equation, when we were not controlling for variable B (peer attachment). For each multiple regression analysis age and gender were entered on step one as a control procedure, with the hypothesized predictor variables entered on step 2. In the first regression, although the overall model was significant ($R^2 = 0.11$, Adjusted $R^2 = .10$, $F(3, 405) = 16.56$, $p < .001$), social phobia failed to significantly predict peer attachment. The only significant predictor was gender ($\beta = .32$, $t = 6.86$, $p < .001$). In the second regression, using social phobia to predict identity, the overall model was significant ($R^2 = 0.19$, Adjusted $R^2 = .18$, $F(3, 403) = 30.68$, $p < .001$) with standardized beta coefficients reaching significance for gender ($\beta = .21$, $t = 4.61$, $p < .001$) and social phobia ($\beta = -.36$, $t = -7.98$, $p < .001$). In the third regression, using both social phobia and peer attachment to predict identity, the overall model was again significant ($R^2 = 0.35$, Adjusted $R^2 = .35$, $F(4, 402) = 54.37$, $p < .001$) with standardized beta coefficients reaching significance for both peer attachment ($\beta = .43$, $t = 10.12$, $p < .001$) and social phobia ($\beta = -.36$, $t = -8.98$, $p < .001$). Thus, while social phobia and peer attachment both significantly predicted identity, there was no mediation.

The second hypothesis stated that cultural values of collectivism and individualism would moderate the relationship between social phobia and identity such that social phobia would have a greater negative impact on identity among those with a collectivistic orientation. To test this, another regression analysis was conducted. Gender and age were entered on step 1, social phobia

score on step 2, individualistic and collectivistic orientation scores on step 3, and the interaction terms of social phobia with individualistic orientation and social phobia with collectivistic orientation entered on step 4, with identity score as the dependent variable. In accordance with the procedure for testing moderating effects as proposed by Holmback (1997), interaction terms are created by centering the predictor variable (i.e. subtracting each score from the mean, and then multiplying the two predictor scores together). Thus two interaction terms were created, which are Social Phobia/Individualism and Social Phobia/Collectivism. On step 3, the overall model was significant ($R^2 = 0.22$, Adjusted $R^2 = .21$, $F(5, 401) = 22.38$, $p < .001$) with standardized beta coefficients reaching significance for social phobia ($\beta = -.34$, $t = -7.45$, $p < .001$) and collectivistic orientation ($\beta = .17$, $t = 3.48$, $p = .001$). However, on step 4, the change in F was not significant and neither of the interaction terms was significant thus suggesting that while collectivistic orientation was associated with higher identity scores, it did not moderate the negative relationship between social phobia and identity.

To further elucidate the relationship of collectivistic orientation to the other study variables several more exploratory regression analyses were conducted. Collectivistic orientation significantly predicted social phobia ($R^2 = .03$, Adjusted $R^2 = .02$, $F(3, 405) = 3.84$, $p = .01$; $\beta = -.14$, $t = -2.81$, $p = .005$). Collectivistic orientation also significantly predicted peer attachment ($R^2 = .12$, Adjusted $R^2 = .11$, $F(3, 405) = 18.34$, $p < .001$) with standardized beta coefficients reaching significance for gender ($\beta = .31$, $t = 6.47$, $p < .001$) and collectivistic orientation ($\beta = .10$, $t = 2.18$, $p = .03$). In neither case did further mediational analyses reach significance. Thus, it would appear that the relationship between variables could best be explained by Figure 4.

Further exploratory analyses were conducted to determine if the relationship between variables would be the same for each sampled country. For the USA sample peer attachment mediated the relationship between collectivism and identity. In the first regression, collectivism predicted peer attachment ($R^2 = .25$, Adjusted $R^2 = .23$, $F(3, 142) = 15.47$, $p < .001$) with standardized beta coefficients reaching significance for gender ($\beta = .29$, $t = 3.95$, $p < .001$) and collectivistic orientation ($\beta = .37$, $t = 5.03$, $p < .001$). In the second regression, collectivism predicted identity ($R^2 = .12$, Adjusted $R^2 = .11$, $F(3, 142) = 6.70$, $p < .001$) with standardized beta coefficients reaching significance for gender ($\beta = .18$, $t = 2.32$, $p = .022$) and collectivistic orientation ($\beta = .26$, $t = 3.28$, $p = .001$). In the third regression, using both collectivism and peer attachment to predict identity, the equation was significant ($R^2 = .34$, Adjusted $R^2 = .32$, $F(4, 141) = 18.38$, $p < .001$) with standardized beta coefficients reaching significance for age ($\beta = .14$, $t = 2.08$, $p = .039$) and peer attachment ($\beta = .54$, $t = 6.85$, $p < .001$). Thus, when controlling for peer attachment, collectivism was no longer a significant predictor of identity, thereby fulfilling the criteria for mediation. Social phobia predicted peer attachment ($R^2 = .24$, Adjusted $R^2 = .23$, $F(3, 142) = 15.16$, $p < .001$) with standardized beta coefficients reaching significance for gender ($\beta = .31$, $t = 4.35$, $p < .001$) and social phobia ($\beta = -.36$, $t = -4.95$, $p < .001$). Social phobia also predicted identity ($R^2 = .32$, Adjusted $R^2 = .31$, $F(3, 142) = 22.25$, $p < .001$) with standardized beta coefficients reaching significance for gender ($\beta = .20$, $t = 2.80$, $p = .006$) and social phobia ($\beta = -.51$, $t = -7.40$, $p < .001$). However, social phobia did not predict collectivism nor did it mediate any of the other relationships. Thus the American model can best be described by Figure 5.

For the Chinese sample, social phobia mediated the relationship between peer attachment and identity. In the first regression, peer attachment *positively* predicted social phobia ($R^2 = .24$, Adjusted $R^2 = .23$, $F(3, 175) = 18.63$, $p < .001$; $\beta = .49$, $t = 7.45$, $p < .001$). In the second regression, peer attachment *negatively* predicted identity ($R^2 = .07$, Adjusted $R^2 = .05$, $F(3, 174) = 4.29$, $p = .006$; $\beta = -.25$, $t = -3.33$, $p = .001$). In the third regression using both social phobia and peer attachment to predict identity, the equation was significant ($R^2 = .18$, Adjusted $R^2 = .16$, $F(4, 173) = 9.48$, $p < .001$) with standardized beta coefficients reaching significance only for social phobia ($\beta = -.38$, $t = -4.84$, $p < .001$). Thus, when controlling for social phobia, peer attachment was no longer a significant predictor of identity, thereby fulfilling the criteria for mediation. Collectivism predicted identity ($R^2 = .15$, Adjusted $R^2 = .13$, $F(3, 174) = 10.15$, $p < .001$; $\beta = .38$, $t = 5.34$, $p < .001$), but was unrelated to social phobia and peer attachment, and it did not mediate any of the other relationships. Thus the Chinese model can best be described by Figure 6. None of the predictive analyses were significant for the Indian sample.

CHAPTER FOUR: DISCUSSION

The three samples were significantly different in identity, peer attachment, and collectivistic orientation. Although the American sample scored highest in identity it is important to keep in mind that the scale used to measure identity development was created and normed on Western participants. Cross, Gore, and Morris (2003) pointed out that although the normal path of identity development in Western industrialized mainstream society may be to explore and seek out a personal sense of identity, one's sense of identity may come more from group membership (e.g., family, community, country) and may have more interpersonal significance in Asian societies. Thus the Indian and Chinese sample may not necessarily have a weaker sense of identity, but rather, perhaps they have a less Westernized sense of identity. One might be tempted to attribute this to a more collectivistic cultural orientation, but this was only true for the Indian sample. They scored highest in collectivism and lowest in identity, supporting this view that the concept of identity is individualistic and culturally defined. However, most surprisingly, the Chinese sample was least collectivistic of the three. One should keep in mind that these are college students and Chinese college students may not be typical of the general population in terms of ascribing to collectivistic values. In addition these college students were attending schools in very large urban areas, one of which was in Beijing, the capital of China. In contrast, the American students were attending school in Orlando, a more suburban populated city. Geographic and socio-economic origins may heavily influence cultural values and these things were not controlled for in this study. Also, China is undergoing vast changes, becoming the world's fastest growing economy, and with this growth has come greater openness and exposure to the global culture (Shirk, 2008). Assumptions about its people and culture may need to be

revised given the recent changes. At minimum, these findings caution one against assuming a person's cultural values based purely on their country of residence.

The American sample scored highest in peer attachment, but given the very low internal consistency of the alienation subscale, which made up part of the total peer attachment score, this finding can be seriously called into question. However, the other two subscales (trust and communication) used to comprise the total peer attachment score did have good internal consistency across all three samples, and on both these scales, the American group scored significantly higher than the other two groups (which did not score significantly different from each other).

In regard to the main hypotheses of this study, a model was put forth which suggested that stronger peer attachment can facilitate identity development, while social phobia inhibits identity development, primarily because it inhibits peer attachment. It was further posited that these relationships would be strongest among those who held a more collectivistic cultural value orientation (see Figure 1). Although many of these relationships held up, the overall model did not. Thus, social phobia was negatively associated with identity scores and peer attachment was positively associated with identity scores, but surprisingly, social phobia was unrelated to peer attachment. Collectivism, rather than moderating these relationships, had direct effects on each variable (see Figure 4). Collectivistic orientation was positively associated with peer attachment and identity, and negatively associated with social phobia. Thus, it would appear that people who subscribe to a more collectivistic cultural value system tend to have less social phobia, stronger peer attachment and a stronger sense of identity. It makes intuitive sense that those who are more oriented toward others would have less social phobia and stronger peer attachments, but its

relationship with identity is less obvious. It is especially perplexing given the earlier stated argument that the concept of identity is a very westernized, individualistic construct. However, before placing too much stock in these findings the reader should be again cautioned that the peer attachment measure appears to be flawed in its use with the Indian and Chinese samples. Thus the results obtained on the American sample alone might be more informative in regard to the relationship between these variables, despite the fact that such analyses limit one's ability to generalize the findings beyond this specific country.

When examining the data gathered on the American sample alone, a clear mediational model emerged (see Figure 5). A collectivistic value orientation was associated with stronger peer attachment, and stronger peer attachment was associated with a stronger sense of identity. Although collectivism was associated with identity, its effects were mediated through peer attachment, and when controlling for peer attachment, collectivism was no longer associated with identity. Social phobia, on the other hand, had direct effects on peer attachment and identity. Those who were more social phobic tended to have weaker peer attachments and a weaker sense of identity. Although this is not exactly the model that was originally predicted, it is consistent with the idea that identity is at least partially formulated within the context of others, and limitations to interacting with others, such as that which results from social phobia, would inhibit one's ability to formulate a strong sense of identity. However, social phobia's inhibitory effects on identity do not appear to be limited to those that emanate from weaker peer attachment. It could be that social phobia interferes with one's ability to seek out experiences that may enhance identity formation. If one avoids social situations one is likely to limit

exposure to a variety of experiences, and perhaps it is the limited life experiences in general, and not just the social aspects of those experiences that affect identity development.

The pattern of results stemming from the Chinese sample raises more questions than answers. Although a statistically significant model of mediation did emerge (see Figure 6), it was quite counter-intuitive. In particular it is hard to explain why peer attachment was positively associated with social phobia and negatively associated with identity. One might dismiss these findings due to the low internal consistency of the alienation subscale which partially comprised the peer attachment total score. However, this begs the question as to why the alienation subscale failed to hold together. Further, the other two subscales of peer attachment, trust and communication, did have good internal consistency, yet these too were positively associated with social phobia and negatively associated with identity. Nothing found in the literature seemed to support these results, thus replication should probably precede any attempt to further conjectures on the meaning of these findings. Likewise the lack of any meaningful associations between these study variables in the Indian sample was disappointing and confusing. Clearly more research is necessary to better understand the cross-cultural meaning of these constructs and their measurement. These results also speak to the clear need for caution when attempting to generalize findings from one country to other countries and cultures.

Certain limitations of this study should be noted. The samples were not balanced in regard to gender (i.e., the American sample was predominantly female) nor age (i.e., the Indian sample was significantly older than the other two). Other demographic variables such as socio-economic status and geographic origin (e.g., urban vs. rural) were not measured and may have confounded the results. Future studies should attempt to measure and control for these variables

and attempt to achieve more balanced samples. Also, the measures used are self-report which have certain limitations such as the possibility of responding to questions with answers that are perceived as more socially desirable. Although it would be difficult to assess such internalized traits such as attachment, identity, values, and anxiety in a manner other than self-report, future studies could attempt to include reports from significant others (e.g., friends, parents, teachers) that might serve to foster more confidence in the findings, as well as revealing a fuller picture of the constructs as they are behaviorally displayed. And finally, the cross-sectional and correlational nature of this study design prohibits the inference of causal assumptions. Although the association between certain variables was established, it is not possible from this design to determine which ones are causing which. Although we have offered some theoretical conjectures throughout this paper, nothing written here should be taken as proof of a causal relationship. Longitudinal studies could be very informative and helpful in addressing some of these concerns.

APPENDIX A: APPROVAL OF EXEMPT HUMAN RESEARCH

University of Central Florida Institutional Review Board
Office of Research & Commercialization
12201 Research Parkway, Suite 501
Orlando, Florida 32826-3246

Approval of Exempt Human Research

From: UCF Institutional Review Board #1
FWA00000351, IRB00001138

To: Shengnan Li and Garima Jhingon

Date: August 01, 2011

Dear Researcher:

On 8/1/2011, the IRB approved the following activity as human participant research that is exempt from regulation:

Type of Review: UCF IRB Initial Review Submission Form
Project Title: Identity and Close Personal Relationships as Moderated by Culture.
Investigator: Shengnan Li
IRB Number: SBE-11-07767
Funding Agency: None

This determination applies only to the activities described in the IRB submission and does not apply should any changes be made. If changes are made and there are questions about whether these changes affect the exempt status of the human research, please contact the IRB. When you have completed your research, please submit a Study Closure request in iRIS so that IRB records will be accurate.

In the conduct of this research, you are responsible to follow the requirements of the Investigator Manual.

On behalf of Kendra Dimond Campbell, MA, JD, UCF IRB Interim Chair, this letter is signed by:

Signature applied by Janice Turchin on 08/01/2011 11:45:31 AM EDT

A handwritten signature in black ink that reads "Janice Turchin".

APPENDIX D: INFORMED CONSENT--CHINESE SAMPLE

研究说明

课题题目：自我认同和亲密人际关系以及文化作为影响因素

主要研究者：Shengnan Li 和 Garima Jhingon

指导教师：Steven L. Berman 博士。

你被邀请参加这个研究调查。是否要参加取决于你。

- 这个研究的目的是要了解亲密人际关系对自我认同的影响以及可能的文化差异在其中的影响。研究会通过观察亲密人际关系包括友谊和恋爱关系来探讨性别和文化，以及在三个不同文化背景下（美国，中国和印度）他们和自我认同的关系。
- 你需要完成一个调查，其中包括基本信息和一些有关到你的关系，信仰，和价值的短的问卷。这个调查是匿名的，你不需要在问卷上写你的名字。结果只会以集体数据的形式呈现并报告。
- 这个调查包括 223 道题目以及基本信息，需要大约 1 小时 30 分钟来完成。

你必须是满 18 岁或以上才可以参加这个调查。

关于研究的问题或报告问题的学术联系事宜：如果你有问题，担心，或投诉，请通过 shengnanli2010@knights.ucf.edu 联系 Shengnan Li, 研究生, 临床心理学专业,; 通过 garimajhingon@knights.ucf.edu 联系 Garima Jhingon, 研究生, 临床心理学专业,; 或者通过 (386) 506-4049 或 Steven.Berman@ucf.edu 联系 Berman 博士, 指导老师, 临床心理学专业。

关于你在研究中的权利或投诉的 IRB 联系事宜：在中佛罗里达大学有关人类参与者的研究都是在 Institutional Review Board 的监督下进行的。这个研究已经被 IRB 审查并通过。有关参与者的权利的信息，请联系 Institutional Review Board, University of Central Florida,

Office of Research & Commercialization, 12201 Research Parkway, Suite 501, Orlando, FL
32826-3246 或致电 (407) 823-2901.

APPENDIX E: SURVEY INSTRUMENT— CHINESE SAMPLE

基本資料問卷

請使用所發給的答題卡填寫下面基本資料。

姓名：請留空白

性別：請填 男 或 女

年級：請選擇你的年級

生日：請留空白

識別碼：

A：在 A 欄中選擇你的婚姻狀態。

(0) 單身

(1) 已婚

(2) 離婚

(3) 喪偶(寡婦或鰥夫)

(4) 分居

BC：在 BC 欄中選擇你的年齡。

現在請你(使用答案紙和背面問卷)開始填寫。謝謝你。

IPPA

對於以下的描述, 請決定你同意或不同意的程度. 利用下述的等級, 請在答案卡上填選(塗黑)一個最適當的代號.

A	B	C	D	E
从不是这样	很少是这样	有时是这样	经常是这样	总是这样

| 223. | 有时候我和陌生人在一起时会变得僵硬和脸红。 | | | |

APPENDIX F: INFORMED CONSENT--INDIA SAMPLE

EXPLANATION OF RESEARCH

Title of Project: Identity and Close Personal Relationships as Moderated by Culture.

Principal Investigators: Shengnan Li and Garima Jhingon

Faculty Supervisor: Dr. Steven L. Berman

You are being invited to take part in a research study. Whether you take part is up to you.

- The purpose of this research is to study possible cultural differences in the effects of close personal relationships on identity. It will explore gender and culture by looking at close personal relationships, including friendships and romantic relationships, as they related to conceptions of identity, in three cultural contexts: China, USA and India.
- You will be asked to complete a survey which includes demographics as well as a few short questionnaires relating to your relationships, beliefs, values etc. The survey is anonymous; you will not be asked to write your name on the questionnaires. Results will only be reported in the form of group data.
- The survey contains 223 questions in addition to the demographics, requiring not more than 1.5 hours for completion.

You must be 18 years of age or older to take part in this research study.

Study contact for questions about the study or to report a problem: If you have questions, concerns, or complaints contact Shengnan Li, Graduate Student, Clinical Psychology Program, at shengnanli2010@knights.ucf.edu; Garima Jhingon, Graduate Student, Clinical Psychology Program, at garimajhingon@knights.ucf.edu; or Dr. Berman, Faculty Supervisor, Psychology Department, at (386) 506-4049 or Steven.Berman@ucf.edu

IRB contact about your rights in the study or to report a complaint: Research at the University of Central Florida involving human participants is carried out under the oversight of the Institutional Review Board (UCF IRB). This research has been reviewed and approved by the IRB. For information about the rights of people who take part in research, please contact: Institutional Review Board, University of Central Florida, Office of Research & Commercialization, 12201 Research Parkway, Suite 501, Orlando, FL 32826-3246 or by telephone at (407) 823-2901.

APPENDIX G: SURVEY INSTRUMENT--INDIA SAMPLE

BACKGROUND QUESTIONNAIRE

Please use the Bubble Sheet provided to fill in your background information as follows:

Name: Leave blank.

Sex: Mark MALE or FEMALE

Grade: Mark your grade level.

Birth Date: Leave blank.

Identification NO:

A: Mark your **Marital Status** under column **A**

(0) Single

(1) Married

(2) Divorced

(3) Widowed

(4) Separated

BC: Mark your **Age** under columns **B & C**

Now please turn over both the bubble sheet and this page, and complete the survey. Thank you.

IPPA - The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you using the following scale:

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

1. I like to get my friends' opinions on things I'm concerned about.
2. My friends sense when I'm upset about something.
3. When we discuss things, my friends consider my point of view.
4. Talking over my problems with my friends makes me feel ashamed or foolish.
5. I wish I had different friends.
6. My friends understand me.
7. My friends encourage me to talk about my difficulties.
8. My friends accept me as I am.
9. I feel the need to be in touch with my friends more often.
10. My friends don't understand what I'm going through these days.
11. I feel alone or apart when I am with my friends.
12. My friends listen to what I have to say.
13. I feel my friends are good friends.
14. My friends are fairly easy to talk to.
15. When I am angry about something, my friends try to be understanding.
16. My friends help me to understand myself better.
17. My friends are concerned about my well-being.
18. I feel angry with my friends.
19. I can count on my friends when I need to get something off my chest.
20. I trust my friends.
21. My friends respect my feelings.
22. I get upset a lot more than my friends know about.
23. It seems as if my friends are irritated with me for no reason.
24. I tell my friends about my problems and troubles.
25. If my friends know something is bothering me, they ask me about it.

EIPQ - For the following 32 statements, please decide how much you agree or disagree with each, using the following scale:

A	B	C	D	E
Strongly Disagree	Slightly Disagree	Neutral	Slightly Agree	Strongly Agree

26. I have definitely decided on the occupation I want to pursue.
27. I don't expect to change my political principles and ideals.
28. I have considered adopting different kinds of religious beliefs.
29. There has never been a need to question my values.
30. I am very confident about which kinds of friends are best for me.
31. My ideas about men's and women's roles have never changed as I became older.
32. I will always vote for the same political party.
33. I have firmly held views concerning my role in my family.
34. I have engaged in several discussions concerning behaviors involved in dating relationships.
35. I have considered different political views thoughtfully.
36. I have never questioned my views concerning what kind of friend is best for me.
37. My values are likely to change in the future.
38. When I talk to people about religion, I make sure to voice my opinion.
39. I am not sure about what type of dating relationship is best for me.
40. I have not felt the need to reflect on the importance I place on my family.
41. Regarding religion, my views are likely to change in the near future.
42. I have definite views regarding the ways in which men and women should behave.
43. I have tried to learn about different occupational fields to find the one best for me.
44. I have undergone several experiences that made me change my views on men's and women's roles.
45. I have re-examined many different values in order to find the ones which are best for me.
46. I think that what I look for in a friend could change in the future.
47. I have questioned what kind of date is right for me.
48. I am unlikely to alter my vocational goals.
49. I have evaluated many ways in which I fit into my family structure.
50. My ideas about men's and women's roles will never change.
51. I have never questioned my political beliefs.
52. I have had many experiences that led me to review the qualities that I would like my friends to have.
53. I have discussed religious matters with a number of people who believe differently than I do.
54. I am not sure that the values I hold are right for me.
55. I have never questioned my occupational aspirations.
56. The extent to which I value my family is likely to change in the future.
57. My beliefs about dating are firmly held.

BSI 18 - Below is a list of problems people sometimes have. Read each one carefully and mark the option best describes HOW MUCH THAT PROBLEM HAS DISTRESSED OR BOTHERED YOU DURING THE PAST 7 DAYS INCLUDING TODAY.

A	B	C	D	E
Not at all	A little bit	Moderately	Quite a bit	Extremely

- 58. Faintness or dizziness
- 59. Feeling no interest in things
- 60. Nervousness or shakiness inside
- 61. Pains in heart or chest
- 62. Feeling lonely
- 63. Feeling tense or keyed up
- 64. Nausea or upset stomach
- 65. Feeling blue
- 66. Suddenly scared for no reason
- 67. Trouble getting your breath
- 68. Feelings of worthlessness
- 69. Spells of terror or panic
- 70. Numbness or tingling in parts of your body
- 71. Feeling hopeless about the future
- 72. Feeling so restless you couldn't sit still
- 73. Feeling weak in parts of your body
- 74. Thoughts of ending your life
- 75. Feeling fearful

ECR - The following statements concern how you feel in romantic relationships. We are interested in how you generally experience relationships, not just in what is happening in a current relationship. Respond to each statement by indicating how much you agree or disagree with it. Please fill in your rating on the Bubble Sheet, using the following rating scale:

A	B	C	D	E
Strongly Disagree	Slightly Disagree	Neutral	Slightly Agree	Strongly Agree

76. I prefer not to show how I feel deep down.
77. I worry about being abandoned.
78. I am very comfortable being close to romantic partners.
79. I worry a lot about my relationships.
80. Just when my partner starts to get close to me I find myself pulling away.
81. I worry that romantic partners won't care about me as much as I care about them.
82. I get uncomfortable when a romantic partner wants to be very close.
83. I worry a fair amount about losing my partner.
84. I don't feel comfortable opening up to romantic partners.
85. I often wish that my partner's feelings for me were as strong as my feelings for him/her.
86. I want to get close to my partner, but I keep pulling back.
87. I often want to merge completely with romantic partners, and this sometimes scares them away.
88. I am nervous when partners get too close to me.
89. I worry about being alone.
90. I feel comfortable sharing my private thoughts and feelings with my partner.
91. My desire to be very close sometimes scares people away.
92. I try to avoid getting too close to my partner.
93. I need a lot of reassurance that I am loved by my partner.
94. I find it relatively easy to get close to my partner.
95. Sometimes I feel that I force my partners to show more feeling, more commitment.
96. I find it difficult to allow myself to depend on romantic partners.
97. I do not often worry about being abandoned.
98. I prefer not to be too close to romantic partners.
99. If I can't get my partner to show interest in me, I get upset or angry.
100. I tell my partner just about everything.
101. I find that my partner(s) don't want to get as close as I would like.
102. I usually discuss my problems and concerns with my partner.
103. When I'm not involved in a relationship, I feel somewhat anxious and insecure.
104. I feel comfortable depending on romantic partners.
105. I get frustrated when my partner is not around as much as I would like.
106. I don't mind asking romantic partners for comfort, advice, or help.
107. I get frustrated if romantic partners are not available when I need them.
108. It helps to turn to my romantic partner in times of need.
109. When romantic partners disapprove of me, I feel really bad about myself.

110. I turn to my partner for many things, including comfort and reassurance.
111. I resent it when my partner spends time away from me.

IDS - To what degree have you recently been upset, distressed, or worried over any of the following issues in your life? (Please select the appropriate response, using the following scale).

A	B	C	D	E
None At All	Mildly	Moderately	Severely	Very Severely

- 112. Long term goals? (e.g., finding a good job, being in a romantic relationship, etc.)
- 113. Career choice? (e.g., deciding on a trade or profession, etc.)
- 114. Friendships? (e.g., experiencing a loss of friends, change in friends, etc.)
- 115. Sexual orientation and behavior? (e.g., feeling confused about sexual preferences, intensity of sexual needs, etc.)
- 116. Religion? (e.g., stopped believing, changed your belief in God/religion, etc.)
- 117. Values or beliefs? (e.g., feeling confused about what is right or wrong, etc.)
- 118. Group loyalties? (e.g., belonging to a club, school group, gang, etc.)
- 119. Please rate your overall level of *discomfort* (how bad they made you feel) about all the above issues as a whole.
- 120. Please rate how much uncertainty over these issues as a whole has interfered with your life (for example, stopped you from doing things you wanted to do, or being happy)
- 121. How long (if at all) have you felt upset, distressed, or worried over these issues as a whole? (Use rating scale below)

Never or less than a month	1 to 3 months	3 to 6 months	6 to 12 months	More than 12 months
A	B	C	D	E

SPS - The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you.

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

- 122. I become anxious if I have to write in front of other people.
- 123. I become self-conscious when using public toilets.
- 124. I can suddenly become aware of my own voice and of others listening to me.
- 125. I get nervous that people are staring at me as I walk down the street.
- 126. I fear I may blush when I am with others.
- 127. I feel self-conscious if I have to enter a room where others are already seated.
- 128. I worry about shaking or trembling when I'm watched by other people.
- 129. I would get tense if I had to sit facing other people on a bus or a train.
- 130. I get panicky that others might see me faint, or be sick or ill.
- 131. I would find it difficult to drink something if in a group of people.
- 132. I am worried people will think my behavior odd.
- 133. It would make me feel self-conscious to eat in front of a stranger at a restaurant.
- 134. I would get tense if I had to carry a tray across a crowded cafeteria.
- 135. I worry I'll lose control of myself in front of other people.
- 136. I worry I might do something to attract the attention of other people.
- 137. When in an elevator, I am tense if people look at me.
- 138. I can feel conspicuous standing in a line.
- 139. I can get tense when I speak in front of other people.
- 140. I worry my head will shake or nod in front of others.
- 141. I feel awkward and tense if I know people are watching me.

EPSI - The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you.

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

- 142. I change my opinion of myself a lot.
- 143. I've got a clear idea of what I want to be.
- 144. I feel mixed up.
- 145. The important things in life are clear to me.
- 146. I've got it together.
- 147. I know what kind of person I am.
- 148. I can't decide what I want to do with my life.
- 149. I have a strong sense of what it means to be male/female.
- 150. I like myself and am proud of what I stand for.
- 151. I don't really know who I am.
- 152. I work keep up a certain image when I'm with people.
- 153. I don't really feel involved.
- 154. I get embarrassed when someone begins to tell me personal things.
- 155. I'm ready to get involved with a special person.
- 156. I'm warm and friendly.
- 157. It is important to be completely open with my friends.
- 158. I keep what I really think and feel to myself.
- 159. I think it's crazy to get too involved with people.
- 160. I care deeply for others.
- 161. I'm basically a loner.
- 162. I have a boyfriend/girlfriend who is a close friend of mine as well as a close romantic partner.
- 163. I prefer not to show too much of myself to others.
- 164. Being alone with other people makes me feel uncomfortable.
- 165. I find it easy to make close friends.

COS – The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you.

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

166. I'd rather depend on myself than others.
167. I rely on myself most of the time; I rarely rely on others.
168. I often do my own thing.
169. My personal identity, independent of others, is very important to me.
170. Being a unique individual is important to me.
171. It is important that I do my job better than others.
172. Winning is everything.
173. Competition is the law of nature.
174. When another person does better than I do, I get tense and aroused.
175. I enjoy working in situations involving competition.
176. Some people emphasize winning; I am not one of them (reversed).
177. Without competition, it is not possible to have a good society.
178. It annoys me when other people perform better than I do.
179. If a coworker gets a prize, I would feel proud.
180. The well-being of my coworkers is important to me.
181. To me, pleasure is spending time with others.
182. I feel good when I cooperate with others.
183. If a relative were in financial difficulty, I would help within my means.
184. It is important to me to maintain harmony in my group.
185. I like sharing little things with my neighbors.
186. My happiness depends very much on the happiness of those around me.
187. Parents and children must stay together as much as possible.
188. It is my duty to take care of my family, even when I have to sacrifice what I want.
189. Family members should stick together, no matter what sacrifices are required.
190. It is important to me that I respect the decisions made by my groups.
191. Children should be taught to place duty before pleasure.
192. I usually sacrifice my self-interest for the benefit of my group.

TKS – The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you.

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

193. I am afraid that I may unintentionally hurt other's feelings.
194. I tend to stop doing what I want to do if others think I am not doing it right.
195. I cannot really feel relaxed even when I chat with my friends.
196. When I see others, sometimes I am afraid that my looks might leave a bad impression on them.
197. Because I perceive myself as having a displeasing appearance, it bothers me to present myself to other people.
198. I am afraid that when talking with others my trembling voice will offend them.
199. Sometimes I stiffen or blush when I am with my friends.
200. I cannot help thinking how my eyes look when someone looks me in the eye.
201. I get more nervous when I see someone I know than when I see a stranger.
202. I am afraid that when talking with others my trembling head, hands and/or feet will offend them.
203. I am afraid that my presence will offend others.
204. When I talk with others, I feel ugly and fear that I bore them.
205. Because I perceive myself as being very awkward, it bothers me to present myself to other people.
206. Sometimes I cannot laugh when I talk with another person because I become very anxious and my face stiffens.
207. I am afraid my family will find out that something is wrong with me and that will trouble them.
208. At a hair dresser's shop, I cannot stand for the hair dresser to look me in the face.
209. I feel small and feel like apologizing to others.
210. I am afraid I will blush in front of other people and as a result offend them.
211. I do not know where I should look when I talk with others.
212. I cannot really feel relaxed when I chat with strangers.
213. When I talk with my friends, I am afraid that they might point out my faults.
214. When I am with others, I sometimes feel that I am stupid and feel sorry for them for being with me.
215. I am afraid that when talking with others my stiff facial expressions will offend them.
216. I am afraid that my sweating or having nervous perspiration will offend other people.
217. I am afraid that my body odors will offend other people.
218. I am afraid that my staring at other people's body parts will offend them.
219. I am afraid that I will release intestinal gas in the presence of others and offend them.
220. I am afraid that eye to eye contact with other people will offend them.

- 221. When I talk to strangers, I am afraid that they might point out my faults.
- 222. I am afraid that my physical appearance will in some way offend others.
- 223. Sometimes I stiffen or blush when I am with strangers.

APPENDIX H: INFORMED CONSENT--USA SAMPLE

EXPLANATION OF RESEARCH

Title of Project: Identity and Close Personal Relationships as Moderated by Culture.

Principal Investigators: Shengnan Li and Garima Jhingon

Faculty Supervisor: Dr. Steven L. Berman

You are being invited to take part in a research study. Whether you take part is up to you.

- The purpose of this research is to study possible cultural differences in the effects of close personal relationships on identity. It will explore gender and culture by looking at close personal relationships, including friendships and romantic relationships, as they related to conceptions of identity, in three cultural contexts: China, USA and India.
- You will be asked to complete a survey which includes demographics as well as a few short questionnaires relating to your relationships, beliefs, values etc. The survey is anonymous; you will not be asked to write your name on the questionnaires. Results will only be reported in the form of group data.
- The survey contains 223 questions in addition to the demographics, requiring not more than 1.5 hours for completion.

You must be 18 years of age or older to take part in this research study.

Study contact for questions about the study or to report a problem: If you have questions, concerns, or complaints contact Shengnan Li, Graduate Student, Clinical Psychology Program, at shengnanli2010@knights.ucf.edu; Garima Jhingon, Graduate Student, Clinical Psychology Program, at garimajhingon@knights.ucf.edu; or Dr. Berman, Faculty Supervisor, Psychology Department, at (386) 506-4049 or Steven.Berman@ucf.edu

IRB contact about your rights in the study or to report a complaint: Research at the University of Central Florida involving human participants is carried out under the oversight of the Institutional Review Board (UCF IRB). This research has been reviewed and approved by the IRB. For information about the rights of people who take part in research, please contact: Institutional Review Board, University of Central Florida, Office of Research & Commercialization, 12201 Research Parkway, Suite 501, Orlando, FL 32826-3246 or by telephone at (407) 823-2901.

APPENDIX I: SURVEY INSTRUMENT--USA SAMPLE

BACKGROUND QUESTIONNAIRE

Please use the Bubble Sheet provided to fill in your background information as follows:

Name: Leave blank.

Sex: Mark MALE or FEMALE

Grade: Mark your grade level.

Birth Date: Leave blank.

Identification NO:

A: Mark your **Marital Status** under column **A**

- (0) Single
- (1) Married
- (2) Divorced
- (3) Widowed
- (4) Separated

BC: Mark your **Age** under columns **B & C**

Now please turn over both the bubble sheet and this page, and complete the survey. Thank you.

IPPA - The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you using the following scale:

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

1. I like to get my friends' opinions on things I'm concerned about.
2. My friends sense when I'm upset about something.
3. When we discuss things, my friends consider my point of view.
4. Talking over my problems with my friends makes me feel ashamed or foolish.
5. I wish I had different friends.
6. My friends understand me.
7. My friends encourage me to talk about my difficulties.
8. My friends accept me as I am.
9. I feel the need to be in touch with my friends more often.
10. My friends don't understand what I'm going through these days.
11. I feel alone or apart when I am with my friends.
12. My friends listen to what I have to say.
13. I feel my friends are good friends.
14. My friends are fairly easy to talk to.
15. When I am angry about something, my friends try to be understanding.
16. My friends help me to understand myself better.
17. My friends are concerned about my well-being.
18. I feel angry with my friends.
19. I can count on my friends when I need to get something off my chest.
20. I trust my friends.
21. My friends respect my feelings.
22. I get upset a lot more than my friends know about.
23. It seems as if my friends are irritated with me for no reason.
24. I tell my friends about my problems and troubles.
25. If my friends know something is bothering me, they ask me about it.

EIPQ - For the following 32 statements, please decide how much you agree or disagree with each, using the following scale:

A	B	C	D	E
Strongly Disagree	Slightly Disagree	Neutral	Slightly Agree	Strongly Agree

77. I have definitely decided on the occupation I want to pursue.
78. I don't expect to change my political principles and ideals.
79. I have considered adopting different kinds of religious beliefs.
80. There has never been a need to question my values.
81. I am very confident about which kinds of friends are best for me.
82. My ideas about men's and women's roles have never changed as I became older.
83. I will always vote for the same political party.
84. I have firmly held views concerning my role in my family.
85. I have engaged in several discussions concerning behaviors involved in dating relationships.
86. I have considered different political views thoughtfully.
87. I have never questioned my views concerning what kind of friend is best for me.
88. My values are likely to change in the future.
89. When I talk to people about religion, I make sure to voice my opinion.
90. I am not sure about what type of dating relationship is best for me.
91. I have not felt the need to reflect on the importance I place on my family.
92. Regarding religion, my views are likely to change in the near future.
93. I have definite views regarding the ways in which men and women should behave.
94. I have tried to learn about different occupational fields to find the one best for me.
95. I have undergone several experiences that made me change my views on men's and women's roles.
96. I have re-examined many different values in order to find the ones which are best for me.
97. I think that what I look for in a friend could change in the future.
98. I have questioned what kind of date is right for me.
99. I am unlikely to alter my vocational goals.
100. I have evaluated many ways in which I fit into my family structure.
101. My ideas about men's and women's roles will never change.
102. I have never questioned my political beliefs.
103. I have had many experiences that led me to review the qualities that I would like my friends to have.
104. I have discussed religious matters with a number of people who believe differently than I do.
105. I am not sure that the values I hold are right for me.
106. I have never questioned my occupational aspirations.
107. The extent to which I value my family is likely to change in the future.
108. My beliefs about dating are firmly held.

BSI 18 - Below is a list of problems people sometimes have. Read each one carefully and mark the option best describes HOW MUCH THAT PROBLEM HAS DISTRESSED OR BOTHERED YOU DURING THE PAST 7 DAYS INCLUDING TODAY.

A	B	C	D	E
Not at all	A little bit	Moderately	Quite a bit	Extremely

- 109. Faintness or dizziness
- 110. Feeling no interest in things
- 111. Nervousness or shakiness inside
- 112. Pains in heart or chest
- 113. Feeling lonely
- 114. Feeling tense or keyed up
- 115. Nausea or upset stomach
- 116. Feeling blue
- 117. Suddenly scared for no reason
- 118. Trouble getting your breath
- 119. Feelings of worthlessness
- 120. Spells of terror or panic
- 121. Numbness or tingling in parts of your body
- 122. Feeling hopeless about the future
- 123. Feeling so restless you couldn't sit still
- 124. Feeling weak in parts of your body
- 125. Thoughts of ending your life
- 126. Feeling fearful

ECR - The following statements concern how you feel in romantic relationships. We are interested in how you generally experience relationships, not just in what is happening in a current relationship. Respond to each statement by indicating how much you agree or disagree with it. Please fill in your rating on the Bubble Sheet, using the following rating scale:

A	B	C	D	E
Strongly	Slightly	Neutral	Slightly	Strongly
Disagree	Disagree		Agree	Agree

127. I prefer not to show how I feel deep down.
77. I worry about being abandoned.
78. I am very comfortable being close to romantic partners.
79. I worry a lot about my relationships.
80. Just when my partner starts to get close to me I find myself pulling away.
81. I worry that romantic partners won't care about me as much as I care about them.
82. I get uncomfortable when a romantic partner wants to be very close.
83. I worry a fair amount about losing my partner.
84. I don't feel comfortable opening up to romantic partners.
85. I often wish that my partner's feelings for me were as strong as my feelings for him/her.
86. I want to get close to my partner, but I keep pulling back.
87. I often want to merge completely with romantic partners, and this sometimes scares them away.
88. I am nervous when partners get too close to me.
89. I worry about being alone.
90. I feel comfortable sharing my private thoughts and feelings with my partner.
91. My desire to be very close sometimes scares people away.
92. I try to avoid getting too close to my partner.
93. I need a lot of reassurance that I am loved by my partner.
94. I find it relatively easy to get close to my partner.
95. Sometimes I feel that I force my partners to show more feeling, more commitment.
96. I find it difficult to allow myself to depend on romantic partners.
97. I do not often worry about being abandoned.
98. I prefer not to be too close to romantic partners.
99. If I can't get my partner to show interest in me, I get upset or angry.
100. I tell my partner just about everything.
101. I find that my partner(s) don't want to get as close as I would like.
102. I usually discuss my problems and concerns with my partner.
103. When I'm not involved in a relationship, I feel somewhat anxious and insecure.
104. I feel comfortable depending on romantic partners.
105. I get frustrated when my partner is not around as much as I would like.
106. I don't mind asking romantic partners for comfort, advice, or help.
107. I get frustrated if romantic partners are not available when I need them.
108. It helps to turn to my romantic partner in times of need.
109. When romantic partners disapprove of me, I feel really bad about myself.

110. I turn to my partner for many things, including comfort and reassurance.
111. I resent it when my partner spends time away from me.

IDS - To what degree have you recently been upset, distressed, or worried over any of the following issues in your life? (Please select the appropriate response, using the following scale).

A	B	C	D	E
None At All	Mildly	Moderately	Severely	Very Severely

- 112. Long term goals? (e.g., finding a good job, being in a romantic relationship, etc.)
- 113. Career choice? (e.g., deciding on a trade or profession, etc.)
- 114. Friendships? (e.g., experiencing a loss of friends, change in friends, etc.)
- 115. Sexual orientation and behavior? (e.g., feeling confused about sexual preferences, intensity of sexual needs, etc.)
- 116. Religion? (e.g., stopped believing, changed your belief in God/religion, etc.)
- 117. Values or beliefs? (e.g., feeling confused about what is right or wrong, etc.)
- 118. Group loyalties? (e.g., belonging to a club, school group, gang, etc.)
- 119. Please rate your overall level of *discomfort* (how bad they made you feel) about all the above issues as a whole.
- 120. Please rate how much uncertainty over these issues as a whole has interfered with your life (for example, stopped you from doing things you wanted to do, or being happy)

- 121. How long (if at all) have you felt upset, distressed, or worried over these issues as a whole? (Use rating scale below)

- 164. Being alone with other people makes me feel uncomfortable.
- 165. I find it easy to make close friends.

COS – The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you.

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

166. I'd rather depend on myself than others.
167. I rely on myself most of the time; I rarely rely on others.
168. I often do my own thing.
169. My personal identity, independent of others, is very important to me.
170. Being a unique individual is important to me.
171. It is important that I do my job better than others.
172. Winning is everything.
173. Competition is the law of nature.
174. When another person does better than I do, I get tense and aroused.
175. I enjoy working in situations involving competition.
176. Some people emphasize winning; I am not one of them (reversed).
177. Without competition, it is not possible to have a good society.
178. It annoys me when other people perform better than I do.
179. If a coworker gets a prize, I would feel proud.
180. The well-being of my coworkers is important to me.
181. To me, pleasure is spending time with others.
182. I feel good when I cooperate with others.
183. If a relative were in financial difficulty, I would help within my means.
184. It is important to me to maintain harmony in my group.
185. I like sharing little things with my neighbors.
186. My happiness depends very much on the happiness of those around me.
187. Parents and children must stay together as much as possible.
188. It is my duty to take care of my family, even when I have to sacrifice what I want.
189. Family members should stick together, no matter what sacrifices are required.
190. It is important to me that I respect the decisions made by my groups.
191. Children should be taught to place duty before pleasure.
192. I usually sacrifice my self-interest for the benefit of my group.

TKS – The following statements describe things you may either agree with or disagree with. In the bubble sheet provided, please mark the letter that shows how much you agree or disagree that a statement is true of you or not true of you.

A	B	C	D	E
Never	Rarely	Sometimes	Often	Always
True	True	True	True	True

193. I am afraid that I may unintentionally hurt other's feelings.
194. I tend to stop doing what I want to do if others think I am not doing it right.
195. I cannot really feel relaxed even when I chat with my friends.
196. When I see others, sometimes I am afraid that my looks might leave a bad impression on them.
197. Because I perceive myself as having a displeasing appearance, it bothers me to present myself to other people.
198. I am afraid that when talking with others my trembling voice will offend them.
199. Sometimes I stiffen or blush when I am with my friends.
200. I cannot help thinking how my eyes look when someone looks me in the eye.
201. I get more nervous when I see someone I know than when I see a stranger.
202. I am afraid that when talking with others my trembling head, hands and/or feet will offend them.
203. I am afraid that my presence will offend others.
204. When I talk with others, I feel ugly and fear that I bore them.
205. Because I perceive myself as being very awkward, it bothers me to present myself to other people.
206. Sometimes I cannot laugh when I talk with another person because I become very anxious and my face stiffens.
207. I am afraid my family will find out that something is wrong with me and that will trouble them.
208. At a hair dresser's shop, I cannot stand for the hair dresser to look me in the face.
209. I feel small and feel like apologizing to others.
210. I am afraid I will blush in front of other people and as a result offend them.
211. I do not know where I should look when I talk with others.
212. I cannot really feel relaxed when I chat with strangers.
213. When I talk with my friends, I am afraid that they might point out my faults.
214. When I am with others, I sometimes feel that I am stupid and feel sorry for them for being with me.
215. I am afraid that when talking with others my stiff facial expressions will offend them.
216. I am afraid that my sweating or having nervous perspiration will offend other people.
217. I am afraid that my body odors will offend other people.
218. I am afraid that my staring at other people's body parts will offend them.
219. I am afraid that I will release intestinal gas in the presence of others and offend them.
220. I am afraid that eye to eye contact with other people will offend them.

- 221. When I talk to strangers, I am afraid that they might point out my faults.
- 222. I am afraid that my physical appearance will in some way offend others.
- 223. Sometimes I stiffen or blush when I am with strangers.
