أ.د. عبدالرؤوف على المناهمك

#### Abstract

This study investigates the impact of newspaper content on stock returns and trading volume in Palestinian financial market. The researcher used the textual analysis approach to analyze the content of economic pages in three local newspapers, Al-Hayaa, Al-Ayyam, and Felesteen. To measure the tone of newspaper economic content, the researcher constructed two lists of words that have an economical denote; the first is positive and contains 188 words ( 50 roots and 138 derivatives), the second is negative and contains 155 words ( 50 roots and 105 derivatives). Then he counted the number of occurrence for each word on a daily base to calculate the weight of each word and the score for each day. The study analyzed the content of 8,666 economic pages in the three newspapers form 1 January 2011 to 31 December 2014, the content along this period contains about 16,143,197 words, while the positive and negative words repeated 411,702 times in the texts during the same period. The researcher collected the data about stock returns and trading volume for all listed companies from Palestinian stock market website on a daily base. Using a multivariable regression samples, he studied the impact of the media tone on publishing day and 3 days later. The study found that, form 49 listed companies, only 15 companies have a significant relationship between media tone and trading volume during the publishing day with 3 lagging days. In addition, it found that only 10 companies have a significant relationship between media tone and stock returns during the publishing day with 3 lagging days. In the two cases, some companies responded to the media quickly, in the publishing day, and the response of some companies is slow, came after 3 days of publishing.

Keywords: behavioral finance, textual analysis, media tone, PEX, anomalies, newspaper economic content, investor sentiment.

## الملخص

تبحث هذه الدراسة تأثير محتوى الصحف على عوائد الأسهم وحجم التداول في السوق textual analysis ) المالي الفلسطيني، لقد استخدمنا في هذه الدراسة منهج التحليل النصي لتحليل محتوى الصفحات الاقتصـادية في ثلاث صحف محلية هي الحياة، الأيام، فلسطين. ولتيـاس النغمـة التي كتب بهـا المحتوى الاقتصــادي للصـحف، أنشـأنا قـائمتين مـن الكلمـات ذات الدلالـة الاقتصــادية، القائمـة الأولـى إيجابيـة وتتكـون مـن 188 كلمـة (50 جذر و138 مشتقة)، والثانية تتكون من 155 كلمة (50 جذر و105 مشتقة). ثم قمنا بإحصـاء عدد مرات تكرار كل كلمـة من الكلمـات لإيجـاد وزن كل كلمـة ومقيـاس النغــة الإعلاميـة لكل يوم. ومن أجل ذلك، قمنا بتحليل 8,666 صفحة اقتصادية في الصحف الثلاث في الفترة مـا بين 1 ينـاير 2011 إلـى 31 ديسـمبر 2014، وقـد بلـن عـد الكلمـات الإجمـالي خـلال هـذه الفتـرة
 خـلال تلك الفترة. أمـا البيانـات المتعقـة بعوائد الأسـهم وحجم التداول لكافـة الشركات المدرجـة فجمعناها من خـلا الموقع الالكتروني للسوق. باستخدام نمـاذج الانحدار المتعدد، درسنا أثر النغمة الإعلامية في يوم النشر وفي الأيام الثڭلاثة التاليـة لـه. وتظهر نتائج الدراسـة أنـه من بين 49 شركة مدرجة في السوق، فقط 15 شركة يوجد تأثير للمحتوى الإعلامي على حجم تداول أسهمها خلال يوم النشر والأيام الثلاثة التالية له. كما وجدت الدراسـة أن 10 شركات فقط يوجد تأثير للمحتوى الإعلامي على عوائد أسهمها خلال يوم النشر والأيام الثلاثة التالية له. وفي كلا الحالتين، هناك شركات ذات استجابة سريعة للمحتوى الإعلامي، أي خـلا اليوم الأول، وهناك شركات ذات استجابة بطيئة، لا تستجيب إلا في اليوم الرابع فقط.

بسم الله الرحمن الرحيم

تُوَسْوِسُ بِـِ نَفْسُهُ وَنَحْنُ أَفْرَ بُ إِلَبْهِ مِنْ حَبْلِ الْوَرِبِدِ
[16:ق]
And We have already created man and know what his soul whispers to him, and We are closer to him than his jugular veín

## Epigraph

Even apart from the instability due to speculation, there is the instability due to the characteristic of human nature that a large proportion of our positive activities depend on spontaneous optimism rather than on a mathematical expectation, whether moral or hedonistic or economic.

John Maynard Keynes
The General Theory of Employment, Interest, and Money (1936)

## Dedication

This thesis is dedicated to my father and mother, they have been waiting this moment for a long time, and their prayers were my support,

And to my wife, "Roba" for her eternal love and patience against fatigue and hardship,

And to my brothers and sisters, who provided me with support and encouragement,

And to my dear children, Lana, Lama, and Asem.

أهدي هذه الأطروحة إلى أبي وأمي، لطالما انتظرا هذه اللحظة، وكانت دعواتهما سندي وزادي، وإلى زوجتي "ربا" لحبها وصبرها اللامحدود على التعب والمشقة، وإلى إخوتي وأخواتي الذين غمروني بدعمهم وتثجيعهم، وإلى أبنائي الأعزاء، لانا ولمى وعاصم.

## Acknowledgment

To Dr. Wael Hamdi Al-Daya
Without your encouragement, I could not have the energy to Drill into the rock and collect a huge amount of a very detailed data. It is difficult and too much the problems that I faced, and it is too much the moments that myself whispered me to stop or go back from the goal, but even I feel this, I harried to you and found the hope and renewable energy to go toward the goal.

I would like to thank:
Mr. Mahmoud Yousuf Al-Saftawi for his support and providing the data about PEX, Mr. Hatem Jameel Al-Harazeen for his efforts in data statistically analyzing, And the data collecting and mining team:

1. Fatma Abo Al-Qomsan

## Introduction

## Chapter 1

## Introduction

### 1.1 Background

Finance is a very distinct subject in social sciences. The huge amount of data and information published on the financial market enable researchers to test different hypotheses and theorems at a higher confidence levels than in other subjects in the social sciences. At the same time, the valuable information extracted from the financial data encourage them to rethink the foundations of many theories that are related to financial economics. In the last decades, capital market has passed through two different theories. Each theory has attempted to better explain the movement of market prices. The first and older theory is "traditional finance", and the currently rising theory called "behavioral finance".

Traditional finance, sometimes called "standard finance", assumes that investment agents (individuals or groups) are rational and the law of one price holds. Important aspects of agents' rationality are maximization of expected utility and Bayesian learning (Glaser, Nöth et al. 2004). This implies, for example, that choices are time-consistent. From a market perspective, traditional finance theory rests on the law of one price, which states that securities with the same payoff have the same price.

Traditional finance is based on the classical model of rational economic decision making. In general, standard finance assumes that all individuals are wealth maximizes. In other words, an investor is considered rational if that person selects the most preferred choice, customarily defined as maximizing an individual's utility or value function (Ricciardi 2008). This rational investment decision maker is assumed to maximize profits, possess complete knowledge, and capitalize on his or her own economic well-being.

The foundation of traditional finance is associated with the modern portfolio theory (MPT) and the efficient market hypothesis (EMH). (MPT) is a stock or portfolio's expected return, standard deviation, and its correlation with the other stocks or mutual funds held within the portfolio. With these three concepts, an efficient portfolio can be created for any group of stocks.

An efficient portfolio is a group of stocks that has the maximum expected return given the amount of risk assumed, or on the contrary, contains the lowest possible risk for a given expected return.

Another main theme in traditional finance is (EMH). The (EMH) states the premise that all information has already been reflected in a security's price or market value, and that the current price the stock is trading for today is its fair value (Ricciardi and Simon 2000). Since stocks are considered to be at their fair value, proponents argue that active traders or portfolio managers cannot produce superior returns over time that beat the market.

Ricciardi (2008) summarizes (EMH) forms in the following brief description:

1. The weak form: The market is efficient with respect to the history of all past market prices and information is fully reflected in securities values.
2. The semi-strong form: The market is efficient in which all publicly available information is fully reflected in securities values.
3. The strong form: The market is efficient in that all information is fully reflected in securities prices.

Theoretical challenges to (EMH) appeared in the 1970s pioneering work of cognitive psychologists Amos Tversky and Daniel Kahneman raised questions about rationality of investors. As early as the mid-1980s economists speculated that many traders act not on information but on hunch and that, the market absorbs no more rationality of calculation than it does mere noise.

Because of the inability of efficient market theory to explain the persistence of some patterns in the financial markets, many new theories have emerged to understand these patterns. Most of these theories rely on some kind of human psychological biases and are generally grouped under the category of behavioral finance.

From the beginning of the 1980s, and more in the 1990s, new empirical studies of security prices have reversed some of the earlier evidence favoring the EMH. The traditional finance school named these observations anomalies, because they could not be explained in the neoclassical framework. In the response to a growing number of puzzles, a new approach to financial markets has emerged "behavioral finance". It focuses on investors’ behavior and the decision making
process. In the contrary to the traditional theory, behavioral finance assumes that agents may be irrational in their reactions to new information and make wrong in investment decisions. As a result, markets will not always be efficient and asset pricing may deviate from predictions of traditional market models.

Behavioral finance as a sub discipline of behavioral economics is finance incorporating findings from psychology and sociology into its theories. It focuses on investors' behavior and the decision making process in order to understand anomalous pricing of assets and other puzzling observations taken empirically from capital markets. Behavioral finance models are usually developed to explain investor behavior or market anomalies when rational models provide no sufficient explanations.

Behavioral finance aims at improving the understanding of financial markets and its participants by applying insights from behavioral sciences (e.g. psychology and sociology) (Baltussen 2009). This in sharp contrast to the traditional finance theory, which seeks to understand financial decisions by assuming that markets and many of its participating people and institutions (called economic agents) are rational. That is, they should act in an unbiased fashion and make decisions by maximizing their self-interests. In essence, the economic concept of rationality means that economic agents make the best choices possible for themselves.

Szyszka (2007) defined behavioral finance as an area within the finance discipline that focuses on investors' behavior and the decision making process in order to understand anomalous pricing of assets and other puzzling observations taken empirically from capital markets.

Behavioral finance attempt to understand why financial markets react inefficiently to public information. One stream of behavioral finance examines how psychological forces induce traders and managers to make suboptimal decisions, and how these decisions affect market behavior.

Ricciardi and Simon (2000) defined the various disciplines of behavioral finance as the following:

1. Psychology: is the scientific study of behavior and mental processes, along with how these processes are affected by a human being's physical, mental state, and external environment.
2. Sociology: is the systematic study of human social behavior and groups. This field focuses primarily on the influence of social relationship on people's attitudes and behavior.
3. Finance: is a discipline connected with determining value and making decisions. The finance function allocates capital, including the acquiring, investing, and managing resources.

### 1.2 Problem Statement

Stock market prediction has attracted much attention from academia as well as business. But can the stock market really be predicted? Early research on stock market prediction was based on random walk theory and (EMH). According to the (EMH) stock market, prices are largely driven by new information, i.e. news, rather than present and past prices. Since news is unpredictable, stock market prices will follow a random walk pattern and cannot be predicted with more than 50 percent accuracy (Bollen, Mao et al. 2011). This study contributes to the growing literature on the role of the media in financial markets.

Evaluating the effect of the media on the stock market anomalies became difficult issues. A simple relation between media tone and stock market performance (for example, trading volume and returns) may result from unobserved news shocks, which create an omitted variable bias. Reality, if such shocks generate an unusual market reaction and are simultaneously reported in the press, then the market
reaction and the media reports are correlated, but the media does not cause the unusual reaction. Even in the absence of news shocks, the press may report on the market activity itself, thereby inducing a correlation between the media and the market's response.

There is a large amount of evidence that stock prices are predictable. Chan (2003) raised an interesting question. "Is there a predictable difference between stock returns after public news announcements and returns after large price movements, but no public news? But Schumaker and Chen (2006) Saied that no method has been discovered to accurately predict stock price movement. The difficulty of prediction lies in the complexities of modeling human behavior.

Tetlock (2007) measured the interactions between the media and the stock market using content from a popular Wall Street Journal column. He found that high media pessimism robustly predicts downward pressure on market prices and that unusually high or low pessimism forecasts high market trading volume. Tetlock, Saar-Tsechansky et al. (2008) studied a wide selection of newspaper articles in the United States and analyze the relation between individual firms' accounting earnings and stock returns. They found that stock prices under react to negative information and that the predictive power of negative words is largest for stories that focus on fundamentals. Griffin, Hirschey et al. (2011) found that in most developed countries, a firm's stock is more volatile on days on which there is public news about the firm. In emerging markets, however, volatility does not respond to either news or no-news days. Fang and Peress (2009) found that the returns of stocks that have received high media coverage are lower than the returns of stocks receiving low media coverage. Engelberg and Parsons (2011) found that local press coverage significantly affects the daily trading volume of local retail investors.

News media publications play an important role in providing financial market participants with valuable information and aiding investors in forming their views on the stock market (Ferguson, Philip et al. 2014). In recent times, researchers have begun to analyze linguistic data contained in media articles using textual analysis in an attempt to capture hard-to-quantify firm-specific information in news media data and determine the impact on stock prices.

The investment priority of a person is based on several factors like his/her awareness, environment, level of exposure, intensions, beliefs, responsibilities and so on. Every individual is unique because of the individuality of his/her behavioral traits. One of the related researches has been conducted in Italy found that "asset awareness might be of first order importance in determining portfolio selection"

Many previous studies found that stock's return change positively or negatively according to the amount of awareness that the investors have toward it. These Phenomena cannot be seen clearly in the emerging countries because of many reasons, in the other hand, major economies countries such as USA, Europe, Japan, Canada, there are active markets, stock market indices, and other financial media tools, so the relationships between the investor awareness toward a specific stock, and the return on that stock can be seen and traced easily in these countries.

When the investor awareness of a firm's stock increases, the base of the firm's investor will increase, this will lead to a lower required return and, lower cost of capital, and a higher stock price. To protect the interests of investors as well as educate them, the Ministry of Corporate Affairs in India had organized as many as 306 investor awareness programs across the country in November 2013, they are looking at ways to leverage mobile application technology and social media for its financial literacy and investor awareness campaigns.

The relationship between the newspaper content and stock return and trading volume has not been tested in the Palestinian stock market before. In this study, the researcher wants to investigate the impact of newspaper economic content on the stock market anomalies (return, trading volume). Abushammala (2011) found that the (PEX) is an inefficient in weak form by using the analysis of all daily time series of the (PEX) indices during the Period from January 1st, 2007 to December 31st, 2010; therefore, the effect of public media is expected to be larger.

Therefore, the study seeks to answer the following six questions:

1. Do the PEX activities have adequate media coverage in the local newspapers?
2. What is the relation between the firm size and the size of newspaper coverage toward it?
3. Is there a relationship between newspaper coverage and return on stocks listed on the PEX? If yes, what is the form of the relationship?
4. Is there a relationship between newspaper coverage and trading volume for stocks listed on the PEX? If yes, what is the form of the relationship?
5. Does newspaper content impact on stock returns extends for more than a day? Or limited on the publishing day only?
6. Is newspaper content impact on stock trading volume extends for more than a day? Or limited on the publishing day only?

### 1.3 Variables

The study aims to measure the effect of newspaper economic content on the stock return, and trading volume. Therefore, the study has one independent variable, it is the newspaper economic content represented by its tone. This variable affects two dependent variables, stock return and trading volume. Figure (1.2) show the relationship between the study variables. The researcher can define the variables as follow:

### 1.3.1 Dependent variables

### 1.3.1.1 Trading volume (TV)

Trading volume, which represents the total number of traded shares in a particular day, is an important measure of stock performance, and it is also expected to be affected by media tone. Tetlock (2007) found "that high media pessimism predicts downward pressure on market prices followed by a reversion to fundamentals, and unusually high or low pessimism predicts high market trading volume. These results and others are consistent with theoretical models of noise and liquidity traders". Engelberg and Parsons (2011) found that local press coverage significantly affects the daily trading volume of local retail investors.

### 1.3.1.2 Stock return (r)

A fundamental principle of financial economics that asset prices change in response to unexpected fundamental information. Boudoukh, Feldman et al. (2013) found that, when information can be identified and that the tone (i.e., positive versus negative) of this information can be determined, there is a much closer link between stock prices and information. Therefore, it is possible to predict the movement of
stock prices up and down in the short term, depending on the content of news articles.

The daily stock return is considered in this study, is based on the price change of a stock from the close of one trading day to the close of the next trading day. The closing price will be considered in all stock daily return calculations.

Figure (1.2): study variables relationships.

### 1.3.2 Independent variable (media tone MT)

Mass media outlets, such as newspapers, play an important role in disseminating information to a broad audience, especially to individual investors. Every weekday, some 55 million newspaper copies are sold to individual readers in the US, reaching about $20 \%$ of the nation's population (Fang and Peress 2009). To create a quantitative variable from text documents such as news stories, there are different approaches such as financial dictionaries, bag of word, and lists of words, which the researcher will use in this study. It is depending on construction of positive and negative word lists to represent the weight and score of the unstructured text.

The independent variable (media tone), denoted by "MT", will be measured by the score of daily documents; each document consists of all economic pages published in that day at the three newspapers in my sample. After construction of word lists, the researcher will calculate the weight of each word, the weight of the word in each document over the total period, and then, calculate the score of the document by finding the sum of the weight of the negative and positive words appeared in the document. The document score will be represented by a numerical value, positive or negative, depending on the good or bad news appeared in the newspaper economic pages.

### 1.4 Hypotheses development

Several studies analyze the general impact of news stories on financial markets. Engelberg \& Parsons (2011) found that local press coverage significantly affects the daily trading volume of local retail investors. Das \& Chen (2007) applied an algorithm to extract investor sentiment from stock message boards and found that tech-sector postings are related to stock returns. Other studies confirm that news stories are associated with considerable response by the financial sector.

Recent literature provides increasing evidence that the mass media's coverage of individual stocks can influence individual investors' trading behavior.

After reviewing the previous studies, the researcher can develop the following hypothesis:

H1: There is an adequate media coverage in the local newspaper about the Palestinian stock market.

H2: There is a significant positive relationship between media tone in the local newspapers and the trading volume of the stock listed in the market.

H3: There is a significant positive relationship between media tone in the local newspapers and the returns of the stock listed in the market.

H4: There is a significant correlation between media tone in the local newspapers and the stock anomalies (returns and trading volume).

H5: The impact of the media tone in local newspapers on stock trading volume extends for more than a day after the date of publishing.

H6: The impact of the media tone in local newspapers on stock returns extends for more than a day after the date of publishing.

### 1.5 Study Objectives

### 1.5.1 Main objective

The main objective of this study is to analyze whether quantitative measures of newspaper language predict stock market returns. Stock market prediction has attracted much attention in financial research. Popular predictors studied include economic and financial data such as past stock returns, macroeconomic variables,
and time series of balance-sheet data. In addition to economic and financial data, daily newspapers also may contain relevant information for financial markets.

### 1.5.2 Sub objectives

The sub objectives of the study are:

1. To Measure the extent of media coverage of shares traded in "PEX" through analyzing newspaper articles content.
2. To investigate the impact of newspaper coverage and media tone on the stock returns.
3. To investigate the impact of newspaper coverage and media tone on the stock trading volume.

### 1.6 Study Significance

The main importance of this study is using a quantizing model to measure the magnitude and direction of the news tone, and investigating the effect of that tone on the stock returns and trading volume. To my knowledge, it is the first study used the media tone to predict stock returns and trading volume in the Palestinian stock market. All the previous pricing models used standard finance variables such as earning announcements, financial ratios, financial statements and analysis, which are interesting for the professionals only, not for the normal investor. The study is important for three reasons:

1. The first reason, to the best of our knowledge, it is the first study in "PEX" that investigate the impact of media content on the stock return.
2. The second reason, it is introducing a new approach for predicting the stock return and trading volume.
3. The third reason, it expected results, which will be very helpful for all investment parties, firms, investors, analysts, and so on. Additionally, on a broader range, it will contribute to the growth of the national economy.

### 1.7 Study limitations

1. All newspaper documents were written in Arabic, and available in PDF format, in the same time, the software programs, which used in word counting, often do not support Arabic language.
2. The researcher found only one program software supporting the Arabic language, and in which he faced some problems, and beat it with difficulty.
3. The encoding system of newspaper documents is very volatile; there is no unique encoding system for all newspaper taken in the sample over the total period.
4. 49 is the number of listed companies in the financial market, in the first and second level of the market, which is a very limited number comparing with other financial markets.
5. Lack of trading days for some listed companies in the market, almost half of the listed companies have average of annual traded days less than 100 days.

## Chapter 2

Media tone predictability

## Chapter 2

## Media tone predictability

### 2.0 Introduction

This chapter presents a theoretical background about the most important concepts related to the subject of study, including some definitions and findings of the most important studies in this area, and critical elements for the healthy development of the financial market.

In general, the research examines the impact of media content tone on the performance of the stock (returns and trading volume). With respect to stock performance, the number of studies that deal with is very large. Therefore, there is no need to repeat it in my research. So that, this chapter focus on media content tone and how it is measured, and its effects on the individual behavior, decision-making process, and guiding public opinion.

If you have time to read a limited number of researches, why did you choose to read my one? When Investors have time to weigh the advantages of only a limited number of stocks, why do they consider some stocks and not others? In making a decision, the first step is selecting which options to consider, and then decide which of those options to choose. When there are many alternatives, options that attract attention are more likely to be considered, hence more likely to be chosen, while options that do not attract attention are often ignored. If the main properties of an option are critical to our utility, attention may serve us well. If not, attention may lead to sub optimal choices.

Many previous studies found that individual investors are more likely to buy rather than sell those stocks that catch their attention, this called attention Or sentiment affects, Barber and Odean (2008) found that attention affects buying, where investors search across thousands of stocks, more than selling, where investors generally choose only from the few stocks that they own. While each investor does not buy every single stock that grabs his attention, individual investors are more likely to buy attention-grabbing stocks than to sell them.

Public news announcements are a major mechanism for disseminating information to investors. Each day the financial media releases thousands of articles covering companies in markets worldwide. Investors use this news to estimate
assets' fundamental values (Griffin, Hirschey et al. 2011). For individual investors, who typically lack the resources to learn about the vast universe of securities, media coverage can play a significant role in putting certain stocks on their radar screen (Fang, Peress et al. 2014).

Tetlock (2007) measured the interactions between the media and the stock market using content from a popular Wall Street Journal column. He found that high media pessimism robustly predicts downward pressure on market prices and that unusually high or low pessimism forecasts high market trading volume. Tetlock, Saar-Tsechansky et al. (2008) studied a wide selection of newspaper articles in the United States and analyze the relation between individual firms' accounting earnings and stock returns. They found that stock prices under react to negative information and that the predictive power of negative words is largest for stories that focus on fundamentals. Tetlock (2011) showed that stock market returns generally respond less to old (stale) than to new information about firms. Griffin, Hirschey et al. (2011) found that in most developed countries, a firm's stock is more volatile on days on which there is public news about the firm. In emerging markets, however, volatility does not respond to either news or no-news days. Fang and Peress (2009) found that the returns of stocks that have received high media coverage are lower than the returns of stocks receiving low media coverage. Engelberg and Parsons (2011) found that local press coverage significantly affects the daily trading volume of local retail investors

The subject now is how to measure the extent to which a stock attracts investors' attention? A direct measure would be to go back in time and, each day, ask the thousands of investors in the sample to which stocks they thought about that day. Because the daily attention paid to stocks cannot be measured directly, the researcher will measure it indirectly.

The study focuses on one observable measures that are likely to be associated with attention attracting, it is the news written in the daily newspapers which published nationwide. Although the news is not a perfect proxy for attention, but it is useful. An attention attracting is likely to be reported in the news. Investors' attention could be attracted through other means, such as chat rooms or word of mouth, but an event that attracts the attention of many investors is usually newsworthy.

The rest of this chapter is consists of four parts as follows. Part 1 reviews the behavioral finance theory as a new approach for stock returns predicting. Part 2 defines and explains text mining and textual analysis process. Part 3 presents PEX and its listed company's details. And part 4 presents the local newspapers details.

## Part (1) <br> behavioral finance theory

### 2.1.1 Investor behavior

Any person during his/her life takes many decisions; financial decisions are considered important and difficult decisions compared to daily life decisions such as eating, clothing and traveling. Many factors affect the financial decision of investor; one of the most important factors is disseminated information.

There is now a substantial debate over whether observed asset prices are determined purely rationality or also by behavioral characteristics of investors. In general, this debate centers on how investors react to information about a firm. If investors react only rationality, prices should, on average, adjust to news based on its content. Alternately, if investors have behavioral biases towards their private information, they will tend to overreact to public information they agree with and underreact to information they disagree with (Gadarowski 2002).

The decision to invest in the stock exchange also requires awareness of the available financial instruments, an assessment of the risk-return tradeoff as an act of trust, and the overall fairness of the system. Many potential investors do not invest in the stock market because of their limited information on stocks; they do not understand the operations and different pricing strategies of the stock market. Trust and awareness affect stock market participation via two different channels; firstly, Awareness serves to reduce barrier of knowledge of the available assets secondly, trust enhances the confidence level of investors in the stock market (Qureshi, Mehmood et al. 2014).

### 2.1.1.1 Behavioral finance: a new approach for stock returns predicting

Although the "behavioral finance" is considered a relatively new theory in economic and finance field, it is expanding quickly during the last years. This theory aims at providing explanations for investors economic decisions by the linking between two related theories: behavioral and cognitive psychological theory, and conventional economics and finance. There is no doubt that the behavioral finance theory became more famous during the 1990s, but some studies such as Ricciardi and Simon (2000) have indicated that the beginning of this theory back more than 150 years, during the nineteenth century and early twentieth century. Originally
published in 1841, MacKay's Extraordinary Popular Delusions and The Madness of Crowds presents a chronological timeline of the various panics and schemes throughout history. This work shows how group behavior applies to the financial markets of today.

From the previous studies which defined the behavioral finance, the researcher choose the following definitions: first, Ricciardi and Simon (2000) considered that "behavioral finance attempts to explain and increase understanding of the reasoning patterns of investors, including the emotional processes involved and the degree to which they influence the decision-making process. Essentially, behavioral finance attempts to explain the what, why, and how of finance and investing, from a human perspective. For instance, behavioral finance studies financial markets as well as". Second, Glaser, Nöth et al. (2004) introduced two stream of behavioral finance, one stream examines how psychological forces induce traders and managers to make suboptimal decisions, and how these decisions affect market behavior, and the other stream examines how economic forces might keep rational traders from exploiting apparent opportunities for profit. Third, Szyszka (2007) defined behavioral finance as "an area within the finance discipline that focuses on investors' behavior and the decision making process in order to understand anomalous pricing of assets and other puzzling observations taken empirically from capital markets". It has emerged in the response to the difficulties faced by the traditional theory in explaining some financial phenomena". In the remaining part of this section, the researcher will discuss four themes of behavioral finance: overconfidence, financial cognitive dissonance, regret theory, and prospect theory.

### 2.1.1.2 Overconfidence

Overconfidence is a developed psychology theory, which has a great value in behavioral finance field. Overconfidence in behavioral finance meaning that people think they know more than they really do, for example, the investors who achieve high stock returns attribute these returns to their experience in selecting the best stocks and their optimum utilization of the available information, and those investors often trading at a high frequency in the stock market. Many previous studies indicate that overconfidence theory partially able to interpret many of the financial market
phenomena, which the traditional theories failed to interpret them, also it provided new interpretations for some phenomena, such as trading volumes and speculative bubbles. Overconfidence theory can be expressed in several faces, such as miscalibration, better than-average effect, illusion of control, and unrealistic optimism.

## 1. Miscalibration

Miscalibration is one form of overconfidence. The phrase consists of two sections (mis, and calibration) which mean Incorrect or inaccurate calibration. BenDavid, Graham et al. (2010) defined miscalibration as "the systematic underestimation of the range of potential outcomes". Evidence from psychology experiments indicates that subjects are generally miscalibrated. This happens either because most overestimate their ability to predict the future, or because they underestimate the volatility of random events.

The investment decision-making process of investors is irrational and biased because investors make investment decision under certain constraints. These constraints may be associated with the investor, such as their limited capability and commitment, or come from the external environment, such as having access to limited information. Such constraints directly or indirectly, are likely to affect the knowledge structure of investors by influencing their calibration of self-knowledge. Knowledge calibration refer to the correspondence between objective knowledge (OK) and subjective knowledge of self-knowledge.

Because knowledge is an important factor in understanding investor behavior such as information search and information processing, researchers have distinguished between two types of investor knowledge, the first is objective knowledge (OK) that is, what is actually stored in memory, and the second is subjective knowledge (SK) that is, what individual perceive they know.

All of objective knowledge (OK) and subjective knowledge (SK) may be at high or low levels for any investor. Investor who holds accurate knowledge about investment product is considered have a high objective knowledge (high OK), and the investor who highly confident in his knowledge is considered have a high subjective knowledge (high SK), and vice versa. According to the (OK) and (SK) level, there are four probabilities of calibration as follow:

High OK with high SK lead to proper calibration of self- knowledge.

- Low OK with low SK also leads to high calibration.
- High OK with a low SK leads to miscalibration arising from underconfidence.
- Low OK with a high SK leads to miscalibration arising from overconfidence.

We cannot do that if the two types of knowledge (OK and SK) are in the same level (high or low), the investors can be well calibrated because when they possess inaccurate knowledge, they are realistic in their assessment of the low level of knowledge that they possess. Miscalibration results from the lack of correspondence between OK and SK (Harrison and Estelami 2014). Figure (2.1) show the relationship between objective knowledge (OK) and subjective knowledge (SK).

## 2. Better than-average effect

The better than average (BTA) effect is a kind of social comparison in which people evaluate themselves with reference to an average peer or the midpoint of a distribution, which is usually used as a normative standard. Research has consistently shown that people place themselves above this standard, and also above specific peers. Studies on the social comparison phenomena suggests that people have a tendency to believe they are better than others in different ways and that negative events in life are less likely to happen to them than their peers. And undoubtedly that the better than average (BTA) effect can affect investor decision-making process.

Figure (2.1): objective knowledge (OK), subjective knowledge (SK), and calibration matrix.

Source: (Pillai and Hofacker 2007)

### 2.1.1.3 Illusion of control

The illusion of control refers to the tendency for human beings to think they can control or at least affect outcomes, which are clearly controlled by chance. In essence, people often fail to respond differently to controllable and uncontrollable events. A series of previous studies interprets the phenomenon of "illusion of control." Langer (1975) defined illusion of control as "an expectancy of a personal success probability inappropriately higher than the objective probability would warrant". This happens when people think that they have more control over events than objectively can be true. Ackert and Deaves (2009) cited this example to explain the phenomenon: one sees dice players acting as if they can control the outcome of the dice roll, and people actually believe that the risk of infection is partly a function of the character of the person that they are coming into contact with. It is sometimes argued that the illusion of control is beneficial because it can encourage people to take responsibility. It is like when a person is diagnosed with an illness; they want to take control through starting medication or changing their diet or other aspect of their lifestyle.

### 2.1.1.4 Unrealistic optimism

Unrealistic optimism is a form of defensive attribution where people think that good things are more likely to happen to them than to their peers, and that bad things are less likely to happen to them than to their peers. It has important implications in many economic and managerial contexts. Many studies in social psychology found that people judge negative events as less likely to happen to themselves than to the average person, a behavior interpreted as showing that people are "unrealistically optimistic" in their judgments of risk concerning future life events (Harris and Hahn 2011).

The following are some example of such very positive events or very negative events listed in (Ackert and Deaves 2009) about unrealistic optimism: winning the lottery or dying of cancer, students expect to receive higher marks than they actually do receive, overestimate the number of job offers that they will receive, and despite high divorce rates, newlyweds almost universally expect that their marriages will succeed.

### 2.1.2 Financial cognitive dissonance

When a conflict occurs between new information that a human acquires, and what exists previously in his memory of the concepts and facts, the human becomes in a state of anxiety and lack of psychological satisfaction, this phenomenon is called "cognitive dissonance". For example, when people smoke (behavior) and they know that smoking causes cancer (cognition). In psychology, cognitive dissonance is the mental stress or discomfort caused by holding two or more conflicting beliefs at the same time, or from receiving new information conflicting with existing beliefs, ideas or values. Goetzmann and Peles (1997) defined cognitive dissonance in the context of investment decision making as "a psychological cost that investors seek to reduce by adjusting their beliefs about the efficacy of past investment choices".

### 2.1.3 Regret theory

Regret is the third theme of behavioral finance, which affects investor decision-making process. Michenaud and Solnik (2008) defined regret theory as "a cognitively mediated emotion of pain and anger when agents observe that they took a bad decision in the past and could have taken one with better outcome. In financial markets, agents will experience regret when their investment yields, ex post, a lower performance than an obvious alternative investment they could have chosen". Regret theory is closely related to the feeling of responsibility for the decisions that have been taken. Many studies support the hypothesis that regret theory influences the decision-making process in the case of uncertainty. Baker and Nofsinger (2010) found that "to the extent that regret theory guides investors, they are inclined to be more passive".

When talking about regret theory, it useful to indicate to regret aversion, the bias that is associated with risk aversion, it means that when people fear that their decision will be wrong in hindsight, they exhibit regret aversion. Seiler, Seiler et al. (2009) found that regret-averse people may fear the consequences of both errors of omission (e.g., not buying the right [optimal] investment property) and commission (e.g., buying the wrong [suboptimal] investment property).

### 2.1.4 Prospect theory

Prospect theory, which was developed by (Kahneman and Tversky 1979) , is one of the most often quoted and best-documented phenomena in economic psychology. The theory states that we have an irrational tendency to be less willing to gamble with profits than with losses. The theory suggests that people often are interested in avoiding losses more than they are interested in achieving profits. According to prospect theory, losses have more emotional impact than an equivalent amount of gains. For example, in a traditional way of thinking, the amount of utility gained from receiving $\$ 50$ should be equal to a situation in which you gained $\$ 100$ and then lost $\$ 50$. In both situations, the end result is a net gain of $\$ 50$. However, despite the fact that you still end up with a $\$ 50$ gain in either case, most people view a single gain of $\$ 50$ more favorably than gaining $\$ 100$ and then losing $\$ 50$. A number of studies on loss aversion have given birth to a common rule of thumb: Psychologically, the possibility of a loss is on average twice as powerful a motivator as the possibility of making a gain of equal magnitude; that is, a loss-averse person might demand, at minimum, a two-dollar gain for every one dollar placed at risk. In this scenario, risks that do not "pay double" are unacceptable (Pompian 2011). Figure (2.2) show the level of joy and pain at the same amount of losing and gain situation.

### 2.1.5 Awareness and financial literacy

Financial literacy and awareness are critical elements for the healthy development of the financial market. The two terms "Investor awareness" and "Financial literacy" are used interchangeably to denote the process by which investors improve their understanding of financial markets, products, concepts and risks. Many previous studies have defined the two terms. For example, Guiso and Jappelli (2004) defined the investor awareness as "The extent to which consumers are aware of available financial assets depends on the incentives of asset suppliers to spread information about the instruments they issue". Qureshi, Mehmood et al.(2014) found that "The word investor awareness has been used in investor communities regularly. It explains the investor literacy and information about the investment environment or about the financial market". Atkinson and Messy (2011) defined financial literacy as "a combination of awareness, knowledge, skills, attitude and
behaviors necessary to make sound financial decisions and ultimately achieve individual financial wellbeing".

Figure (2.2) the level of joy and pain at the same amount of losing and gain situation.

Source: http://www.investopedia.com
Lusardi and Mitchell (2013) defined financial literacy as "peoples’ ability to process economic information and make informed decisions about financial planning, wealth accumulation, pensions, and debt". The Task Force on Financial Literacy Report, December (2010) defined financial literacy as "having the knowledge, skills and confidence to make responsible financial decisions". The Financial Consumer Agency of Canada Conference report, 9-10 September (2008) defined financial literacy as "Consumers' acquisition of knowledge, skills and confidence to properly manage their personal finances".

The Organization for economic co-operation and development (OECD) Publishing (2005) defined financial education as "the process by which financial consumers/investors improve their understanding of financial products and concepts and, through information, instruction and/or objective advice, develop the skills and confidence to become more aware of financial risks and opportunities, to make informed choices, to know where to go for help, and to take other effective actions to improve their financial well-being". The International organization of securities commissions (IOSCO) Education and Training Team (IOSCO 2012 report) identified the concept of "investor literacy" as the "understanding ordinary investors have of market principles, instruments, organizations and regulations".

Hung, Parker et al. (2009) distinguished between financial literacy and financial education as follows: "Financial literacy is the ability to use knowledge and skills to manage financial resources effectively for a lifetime of financial wellbeing." And "Financial education is the process by which people improve their understanding of financial products, services and concepts, so they are empowered to make informed choices, avoid pitfalls, know where to go for help and take other actions to improve their present and long-term financial well-being".

Moore (2003) considered Individuals are financially literate if they are competent and can demonstrate they have used knowledge they have learned. Financial literacy cannot be measured directly so proxies must be used. Literacy is obtained through practical experience and active integration of knowledge. As people become more literate, they become increasingly more financially sophisticated and it is conjectured that this may also mean that an individual may be more competent.

Mandell (2008) defined the financial literacy as "The ability to evaluate the new and complex financial instruments and make informed judgments in both choice of instruments and extent of use that would be in their own best long-run interests". Lusardi and Tufano (2009) focused on "debt literacy" an important component of overall financial literacy. They defined it as "The ability to make simple decisions regarding debt contracts, applying basic knowledge about interest compounding to everyday financial choices". Bank (2008) defined financial literacy as "The ability to make informed judgments and to take effective decisions regarding the use and management of money".

### 2.1.6 Information dissemination and market efficiency

Among the key elements in the development of financial markets are the quantity and quality of information provided to investors on financial assets and on their issuers. An efficient capital market is characterized as one in which security prices fully reflect all available information. The information about financial assets and issuers can be disseminated through many sources and channels. Such information can be classified into main two sources: the first is company-generated information, which include quarterly and annual reports. And the second is independently generated information, which include analyst created, news outlets,
news wire services, and financial discussion boards. Table (2.1) describes these sources in more details.

The most common definition of market efficiency is (Fama 1970), he defined an efficient market as "one in which prices always 'fully reflect' available information". Jensen (1978) found that "A market is efficient with respect to information set $\theta_{\mathrm{t}}$ if it is impossible to make economic profits by trading on the basis of information set $\theta_{t}{ }^{\prime \prime}$.

Stock market prediction has attracted much attention from academia as well as business. But can the stock market really be predicted? Early research on stock market prediction was based on random walk theory and (EMH). According to the (EMH) stock market prices are largely driven by new information, i.e. news, rather than present and past prices. Since news is unpredictable, stock market prices will follow a random walk pattern and cannot be predicted with more than 50 percent accuracy (Bollen, Mao et al. 2011).

Table (2.1) describes financial assets and issuers information channels.

| Textual <br> Financial <br> Source | Types | Examples | Description |
| :---: | :---: | :---: | :---: |
| Company <br> Generated <br> Sources |  <br> Annual <br> Reports | 8 K | SEC-mandated report on <br> significant company <br> changes |

Source: (Schumaker and Chen 2006)

The market efficiency hypothesis is one of the most famous investment theories in the last thirty years; it achieved a high level of acceptance all over the world. The market efficiency hypothesis (EMH) depends on the available information about the securities and their issuers. It assumes that the financial markets contain a large number of participants who competing on the determined number of securities, the cost of obtaining information is too small, and the cost of securities trading transactions is too small.

The previous empirical studies distinguished between three forms of the (EMH) which was discussed in chapter 1 and it was shown in figure (2.3). Our question here is about the relationship between the (EMH) and behavior finance theory. The answer now become more clearly, the common factor of the two theories is "the information" included inside the news about the firms and their stocks.

Figure (2.3): three forms of the market efficiency hypothesis (EMH)
The (MEH) deals with fundamental information like profit announcements, dividends, analysts' recommendations, and assume that the investors are rational and profit maximizer. In the case of behavioral finance, the base of the information that taken in account is wider, it includes the effects of public economic news on the investor decision making and psychology, and assumes that the investors are irrational.

There is now a substantial debate over whether observed asset prices are determined purely rationality or also by behavioral characteristics of investors. In general, this debate centers on how investors react to information about a firm. If investors react only rationality, prices should, on average, adjust to news based on its content. Alternately, if investors have behavioral biases towards their private information, they will tend to overreact to public information they agree with and underreact to information they disagree with. (Gadarowski 2002)

### 2.1.7 Price and earnings momentum

Price momentum refers to the strategy that buys past winning stocks and sells past losing stocks (Lin 2013). Price momentum entails the observation that past winning stocks continue to deliver superior returns in the short run while past losing stocks subsequently continue to disappoint. Likewise, earnings momentum refers to the observation of momentum in stock prices following the direction of analysts' earnings forecast revisions (Leippold and Lohre 2012).

Ball and Brown (1968) and Bernard and Thomas (1989) found that buying NYSE/AMEX stocks with recent good earnings news, while simultaneously shorting stocks with bad earnings news, can generate positive profits for a holding period of 60 days after earnings announcements. One is that over short-term horizons of 3 to 12 months, future stock returns are positively related to past stock returns, this phenomenon is first documented by Jegadeesh and Titman (1993) and it's also known as the price momentum.

### 2.1.8 Investment decision-making and investor behavior

The decision to participate in the stock exchange requires awareness of the available financial instruments, an assessment of the risk-return tradeoff as an act of trust, and the overall fairness of the system. Many potential investors do not invest in the stock market because of their limited information on stocks; they do not understand the operations and different pricing strategies of the stock market. Trust and awareness affect stock market participation via two different channels. Awareness serves to reduce barrier of knowledge of the available assets whereas trust enhances the confidence level of investors in the stock market. (Qureshi, Mehmood et al. 2014)

How does the investor behave? And how does he make his financial decision, as a reaction to the news? Do key elements exist in the behavioral finance theory? previous studies discussed the investor's decision-making process and the factors influencing it, for example Ali and Tariq (2013) found strong influence of self-image/firm-image coincidence, neutral information, and advocate recommendation on individual equity investor decision making. Whereas, no influences of factors like classic wealth maximization, accounting information and personal financial needs is found on individual equity investor's decision making in the context of Pakistan.

Landström (1998) showed that the decision-making criteria vary to a large extent among different informal investors. The criteria that one investor considers important may be considered less important by another informal investor. Embrey and Fox (1997) found that some investment decisions differ by gender, but gender did not appear to be a critical determinant of investment choice. Women were more likely to hold risky assets if expecting an inheritance, employed and holding higher net worth; while men invested in risky assets if they were risk seekers, divorced, older, and college educated.

### 2.1.9 Investor feelings

Feelings are the main component of human psychology, and they influence human decision-making process. Feelings may make the human optimistic or pessimistic. People in positive mode will be optimistic, and people in negative mode will be pessimistic. The two cases will affect the investment decision. Overall, there is an optimistic outlook toward the global business environment for 2012, as shown in figure (2.4).

Figure (2.4): Level of TNC Optimism for the 2010-2012 Global Investment Environment

## 1: very pessimistic, 5: very optimistic

Source: World Investment Prospects Survey 2010-2012, UNCTAD
Griffin, Hirschey et al. (2011) believed that the differences in market reactions across countries may be driven by variation in (1) pre-announcement public news dissemination; (2) insider trading; (3) the quality of the news transmission mechanism; and (4) accounting quality.

## Part (2) <br> Text mining and textual analysis

### 2.2.1 Text mining and textual analysis: an approach to measure media tone

### 2.2.1.1 What is the text?

Although the text is the most common vehicle for the formal exchange of information. But the main challenge in using the newspaper articles in financial researches is the qualitative nature of the included information, while the data about the stock's price, return, trading volume are all quantitative. So, many previous studies depended on converting the qualitative information included in newspaper articles to quantitative information can be matched to the stock quantitative information in order to measure their impact. These process called "textual analysis" or "text mining". Growing body of finance and accounting research uses textual analysis to examine the tone and sentiment of corporate $10-\mathrm{K}$ reports, newspaper articles, press releases, and investor message board (Loughran and McDonald 2011).

This is what motivates us to highlight the nature of the text and ask ourselves, what is the text? To answer this question, it can be seen that the text is "a piece of spoken or written language". A text may be considered from the point of view of its structure and/or its functions, e.g. warning, instructing, and carrying out a transaction. A full understanding of a text is often impossible without reference to the context in which it occurs.

All texts are about something (i.e., they have content); and the most direct way of taking account of this is through content analysis. Content analysis was first used to measure the objective features (article length, size of headline, etc.) of newspaper stories (Bazerman and Prior 2003). Text data is everywhere, books, news, articles, financial analysis, blogs, social networking, etc. According to estimates, $80 \%$ of world's data is in "unstructured text format" as shown in figure (2.5). Therefore, researchers need methods to extract, summarize, and analyze useful information from unstructured/text data. Text mining seeks to automatically discover useful knowledge from the massive amount of data.

### 2.2.1.2 Structured and unstructured data

Every day, the world produces huge amount of data and information in various fields, previous studies found that the amount of information doubled almost every 18 months, and, as previously noted, roughly $80 \%$ of the data considered unstructured data. Researchers cannot process unstructured data. Therefore, they use some techniques, such as text mining to convert unstructured data into structured forms.

## - Structured data

- Loaded into "spreadsheets"
- Arranged into rows and columns
- Each cell could be filled
- Managed by a database system
- Getting data easily
- Unstructured data
- Microsoft Word, HTML, PDF documents, PPTs
- Usually converted into XML $\rightarrow$ semi structured
- Not structured into cells
- Managed via a search engine due to the lack of structures
- Variable record length, notes, free form survey-answers
- Text is relatively sparse, inconsistent and not uniform
- Include images, video, music etc.

Figure (2.5): the percentage of structured to unstructured data.
Source: IDC 2011 digital universe study.

The common examples of unstructured data are: Emails, insurance claims, news articles, Web pages, patent portfolios, customer complaint letters, contracts, transcripts of phone calls with customers, and technical documents. These forms of data can become structured through 5 stages as follows:

## 1. Information retrieval

Information retrieval (IR) is finding unstructured data source (email, pdf document, and articles) related to the needed information. Cambridge University defined Information retrieval as "finding material (usually documents) of an unstructured nature (usually text) that satisfies an information need from within large collections (usually stored on computers)".

## 2. Information extraction

Automatically extracting structured information from unstructured and/or semi-structured machine-readable documents is called Information extraction process. In most of the cases, this activity concerns processing human language texts by means of natural language processing (NLP).

## 3. Semantic metadata

Haase (2004) defined Semantic metadata as "which links related terms to one another", also it can be defined as "the process of attaching semantic descriptions to Web resources by linking them to a number of classes and properties defined in Ontologies" (Scerri, Abela et al. 2005). Meta data that describes contextually relevant based on an industry-specific Meta data model which known as semantic Meta data. For example, if the content is from the business domain, the relevant semantic Meta data could be company name, ticker symbol, industry, sector, executives, etc.

## 4. Semantic search

Semantic search seeks to improve search accuracy by understanding searcher intent and the contextual meaning of terms as they appear in the searchable data space, whether on the Web or within a closed system, to generate more relevant results. Intent, which comes from the user, explicitly states what he or she is looking for. And context could be understood as everything that surrounds a search and makes this go in either direction, i.e., what gives it meaning. Thus, by understanding
and connecting intention and context, search engines are able to understand the different queries, both what motivates and what is expected of them.

## 5. Knowledge discovery

Knowledge discovery is the process of discovering useful knowledge from a collection of data. This process includes data preparation and selection, data cleansing, incorporating prior knowledge on data sets, and interpreting accurate solutions from the observed results.

Figure (2.6) converting unstructured data into structured data.

### 2.2.1.3 Text mining and textual analysis

The two terms "text mining" and "textual analysis" have been mentioned very frequently in many research and studies in the last 10 years. One of the main things that helped the emergence and growth of this area is the development of computer science and software applications. The results of text mining and analysis become very helpful to a wide range of humanitarian studies such as predicting stock market, sentiment analysis (twitter, Facebook), predicting churn, customer influence, customer service, and help desk. The two terms share in converting the text into structured form that can be used in an advanced stage. Let us now review the two term definitions to extract the difference between them.

The previous studies defined the terms "textual analysis" and "text mining" as follow: Botan, Frey et al. (2000) defined textual analysis as "the method communication researchers use to describe and interpret the characteristics of a recorded or visual message". Jegadeesh and Wu (2013) found that content analysis aims to "objectively characterize the message conveyed by descriptive information in various documents". Chen (2001) defined text mining as "a newer field, performs various searching functions, linguistic analysis, and categorizations". Zorn, Emanoil et al. (1999) found that text mining "offers powerful possibilities for creating knowledge and relevance out of the massive amounts of unstructured information available on the Internet and corporate intranets".

Sullivan (2000) defined text mining as "the study and practice of extracting information from text using the principles of computational linguistics". LUCAS (1999) defined text mining as "a way to examine a collection of documents and discover information not contained in any individual document in the collection". Sebastiani (2002) defined text mining as "increasingly being used to denote all the tasks that, by analyzing large quantities of text and detecting usage patterns, try to extract probably useful (although only probably correct) information". Witten (2005) found that text is unstructured, amorphous, and difficult to deal with algorithmically. He defined text mining as "a burgeoning new field that attempts to glean meaningful information from natural language text. Text mining is the process of analyzing text to extract information that is useful for particular purposes". Biggs (2000) defined text mining as "ideal to inspect changes in the market, or to identify ideas to pursue".

Lucas (2000) defined text mining as "a way to examine a collection of documents and discover information not contained in any individual document in the collection". Hearst (1999) defined text mining as exploratory data analysis as "a method of building and using software systems to support researchers in deriving new and relevant information from large text collections". It is a partially automated process in which the researcher is still involved, interacting with the system. 'The interaction is a cycle in which the system suggests hypotheses and strategies for investigating these hypotheses, and the user either uses or ignores these suggestions and decides on the next.

Through previous definitions of both terms, the researcher found that they generally aim to extract valuable and significance information from unstructured data, this information can be used in various research, but he can distinguish between the two terms according to the nature and the format of extracting information. Text mining aims to put the text in specific templates with no focusing on the text tone, emotion and sentiment. But the textual analysis focuses on these aspects in order to study its effects and relation on the human behaviors. The difference between text mining and textual analysis locks like the difference between the mining and manufacturing in industry sector. Mining generates raw material such as steel, but manufacturing produces products such are cars. Manufacturer can use the steel to produce wide variety of products depending on the production procedures and process. Text mining generate mineral, while textual analysis produce products.

Now the researcher can define the two terms as follow:

## Text mining:

"The process of converting the unstructured text into structured usable format stored in specific templates"

## Textual analysis:

"The process of understanding the content of the unstructured text, and measuring its tone, emotion, sentiment"

### 2.2.1.4 Textual analysis

Textual information processing has become a growing part of empirical finance research. Subsequent studies have applied similar techniques with a variety of news sources, dictionaries, and methodologies. (Heston and Sinha 2014). The purpose of textual analysis is to describe the content, structure, and functions of the messages contained in texts. The important considerations in textual analysis include selecting the types of texts to be studied, acquiring appropriate texts, and determining which particular approach to employ in analyzing them". Text mining is to prospect for nuggets of new knowledge in the mountains of text which have become accessible to computer-based research thanks to the information and internetworking revolution.

There is a growing literature in finance that uses textual analysis to try and convert qualitative information contained in news stories and corporate announcements into a quantifiable measure by analyzing the positive or negative tone of the information (Boudoukh, Feldman et al. 2013). One area of limited success in Stock Market prediction comes from textual data. Information from quarterly reports or breaking news stories can dramatically affect the share price of a security (Schumaker and Chen 2006).

With the large increase in the amount of daily news content on companies over the past decade, it should be no surprise that the finance literature has turned to textual analysis as one way to understand how information both arrives to the marketplace and relates to stock prices of the relevant companies. (Boudoukh, Feldman et al. 2013). Schumaker and Chen (2006) found that "most existing literature on financial text mining relies on identifying a predefined set of keywords and machine learning techniques. These methods typically assign weights to keywords in proportion to the movement of a share price".

### 2.2.1.5 Data mining and text mining

The text is unstructured form of data, so the text mining is more difficult process than data mining, which may deal with structured or semi-structured data. Text mining begins from the text, which may be in document form (doc, pdf, html, etc.), the following table compares between text mining and data mining steps.

Table (2.2): steps of data mining and text mining.

| data mining | text mining |
| :---: | :--- |
|  | - Identify documents |
| - Identify data sets | - Extract features |
| - Select features | - Select features by algorithm |
| - Prepare data | - Prepare data |
| - Analyze distribution |  |

Figure (2.7) explains the locations of the text mining and data mining based on the data type (structured or unstructured) and the information extraction type (search or discover).

|  | Search <br> (goal-oriented) | Discover <br> (opportunistic) |
| :--- | :---: | :---: |
|  | Data |  |
| Structured | Data <br> Retrieval | Data <br> Mining |
| Unstructured <br> Data (Text) | Information <br> Retrieval | Text <br> Mining |

Figure (2.7): locations of text mining and data mining

### 2.2.1.6 Advantages of using news stories to predict firms' earnings and returns

Tetlock, Saar-Tsechansky et al. (2008) called attention to two significant advantages to using the language in everyday news stories to predict firms' earnings and returns:

1. First, by quantifying language, researchers can examine and judge the directional impact of a limitless variety of events, whereas most studies focus on one particular event type, such as earnings announcements, mergers, or analysts' recommendations. Analyzing a more complete set of events that affect firms' fundamental values allows researchers to identify common patterns in firm responses and market reactions to events.
2. Second, linguistic communication is a potentially important source of information about firms' fundamental values. Because very few stock market investors directly observe firms' production activities, they get most of their information secondhand. Their three main sources are analysts' forecasts, quantifiable publicly disclosed accounting variables, and linguistic descriptions of firms' current and future profit-generating activities. If analyst and accounting variables are incomplete or biased measures of firms' fundamentals, linguistic variables may have incremental explanatory power for firms' future earnings and returns.

### 2.2.2 Media tone

In particular, the tone, in which news is written, is a critical factor in shaping public opinion, and thus, its effect on beliefs is an important subject to investigate. A growing body of finance and accounting research uses textual analysis to examine the tone and sentiment of newspaper articles. Broadly, content analysis uses
algorithms that have two important components. The first component is a word list or the algorithms lexicon, where each word is categorized as positive or negative (or as bullish or bearish, etc.). The second component of a content analysis algorithm is how each word in the lexicon should be weighted, which along with its lexicon enables the algorithm to map descriptive content of any document into a quantitative score. (Jegadeesh and Wu 2013). Fang, Peress et al. (2014) found that media tone could be viewed as a proxy for the positive or negative content in the articles, and whether managers buy or sell in accordance with it. Heston and Sinha (2014) found that "positive news stories increase stock returns quickly, but negative stories have a long-delayed reaction". Griffin, Hirschey et al. (2011) found that "If journalists are more sophisticated in certain countries, one might expect news coverage in countries with sophisticated journalists to provide a more precise signal and lead to larger market reactions".

### 2.2.2.1 Media and public opinion shaping

The media is considered as a communication that reaches a large number of people via different distribution channels such as (newspapers, Internet, TV, Radio, Magazines, etc.) Media is a powerful tool for shaping public opinion nowadays. A source of information and education that will shape the daily choices in people's lives. The media affects public opinion because it disseminates the facts and information about key topics that the public should be aware of. Inaccurate reporting means that people have the wrong information about various issues and may make uneducated decisions. Through newspapers, books, magazines and sound recordings, the mass media has been influencing public opinion for more than 500 years. In the 21st century, technology has made it easier to access the messages from the mass media.

For about the last ten years, time series analyses of the links between media reporting and audience behavior have been conducted with increasing frequency. Kepplinger, Donsbach et al. (1989) explained four investigative approaches have been undertaken:

1. Analysis of selected topics and of opinion changes in media reporting. Trends and influences within the media are investigated.
2. Analysis of changes in norms and behavior based on media reporting. Media coverage is viewed as an indicator of overall social change.
3. Analysis of the relationship between the course of events and media reporting. The correspondence between the reality of events and the reality presented by the media or the disparity between them is investigated.
4. Analysis of the interaction between media reporting and public opinion. This essentially deals with the influence of the media on opinion or the influence of the population on the media content.

### 2.2.2.2 Financial journalism

Mass media outlets, such as newspapers, play an important role in disseminating information to a broad audience, especially to individual investors. Famous previous studies such as Tetlock, Saar-Tsechansky et al. (2008) and Tetlock (2007) demonstrated that news stories contain information relevant to predicting both earnings and stock returns. Stock market prediction has attracted much attention in financial research. Popular predictors studied include economic and financial data such as past stock returns, macroeconomic variables, and time series of balance-sheet data. In addition to economic and financial data, daily newspapers also may contain relevant information for financial markets (Ammann, Frey et al. 2014).

Fang and Peress (2009) found that "Every weekday, some 55 million newspaper copies are sold to individual readers in the US, reaching about $20 \%$ of the nation's population". Many previous studies used newspaper articles to measure the volume, the tone, and the sentiment of disseminated information. For example, Tetlock (2007) focused on the immediate influence of the Wall Street Journal's (WSJ's) "Abreast of the Market" column on U.S. stock market returns over the 16year period. Ammann, Frey et al. (2014) Used articles published in the Handelsblatt, a leading German financial newspaper, from July 1989 to March 2011.

Fang, Peress et al. (2014) and Fang and Peress (2009) Collected articles from four daily newspapers with nationwide circulation: USA Today, The Wall Street Journal, The New York Times, and The Washington Post. Gadarowski (2002) collected a count of Dow Jones News Service documents using a ticker search on Dow Jones News/Retrieval for the twelve-month period prior to the return period (July to June). Griffin, Hirschey et al. (2011) collected a large sample of articles
about international stocks from the Factiva news archive which includes major business news publishers such as The Wall Street Journal, Financial Times, Dow Jones, and Reuters. Ferguson, Philip et al. (2014) used news articles from national newspapers that are globally recognized, namely, The Financial Times (FT), The Times, The Guardian and Mirror. Chan (2003) used the Dow Jones Interactive Publications Library of past newspapers, periodicals, and newswires.

### 2.2.2.3 Media coverage

"The media is often modeled as a faceless institution, but its main output news content- is generated by specific people".(Dougal, Engelberg et al. 2012). Previous literature has provided mixed views on the role of press coverage on market efficiency. Chen, Pantzalis et al. (2009) introduced two opposite sides to media coverage, on the positive side, it can function as an external disciplinary mechanism that improves corporate governance or as an information intermediary that provides relevant information to a wide audience. On the negative side, media coverage may be inherently biased or a source of judgment biases and sentiment. Bushee, Core et al. (2010) showed variety roles the press might play in financial markets, including "broad dissemination of information, packaging information from multiple sources, and creating new information through journalism practices".

### 2.2.2.4 Word lists and financial dictionaries

In order to measure the tone of the news, many previous studies began with the word level; they classified the word into three categories, positive, negative, and natural, each word has a specific weight, natural word has no weight. Then, the tone of any news documents can be measured by summing the weight of the negative and positive words appear in it. The major part of literature uses two sources of word lists to measure the tone of media contents, these two sources is:

## 1. Financial dictionaries

A commonly used source is the Harvard Psychosociological Dictionary, specifically, the Harvard-IV-4 TagNeg (H4N) file. One positive feature of this list for research is its composition that is beyond the control of the researcher. That is, the researcher cannot pick and choose which words have negative implications (Loughran and McDonald 2011).

## 2. Financial word list:

A commonly used source is the Loughran and McDonald word lists. They create a list of 2,337 words that typically have negative implications in a financial sense. Some of these words also appear on the H4N list, but others, such as (felony, litigation, restated, misstatement, and unanticipated) do not.

### 2.2.2.5 Word Count Indices

Word-count indices are one technique for summarizing and quantifying text content. Word-count indices count the number of articles mentioning a specific word (Ammann, Frey et al. 2014). Word-count indices are potentially uncorrelated with other predicting variables, such as, macroeconomic data. This makes them a valuable source of additional information which cannot be exploited by common predictors (Ammann, Frey et al. 2014). Text mining is similar to data mining; they aim at finding patterns in unstructured text documents. Word-count indices are one technique for summarizing and quantifying text content. Word-count indices count the number of articles mentioning a specific word. A well-known word-count index is the "R-Word Index" constructed by The Economist (The Economist (1998)). (Ammann, Frey et al. 2014).

## Part (3) <br> Palestinian stock market

### 2.3.1 Palestinian stock market (Palestine Exchange 'PEX")

The Palestine Exchange "PEX" was established in 1995 to promote investment in Palestine as a private shareholding company and transformed into a public shareholding company in February 2010 responding to principles of transparency and good governance. The "PEX" was fully automated upon establishment- the first fully automated stock exchange in the Arab world and the only Arab exchange that is publicly traded and fully owned by the private sector. The "PEX" operates under the supervision of the Palestinian Capital Market Authority. The "PEX" strives to provide an enabling environment for trading that be characterized by equity, transparency and competence, serving and maintaining the interest of investors. The "PEX" is very appealing in terms of market capitalization; it is financially sound, and well capitalized to maintain a steady business in a volatile world, as it passed with the minimum level of impact of the global financial crisis compared to other MENA Exchanges. There are 50 listed companies on "PEX" as of 29/02/2016 with market capitalization of about $\$ 3,339$ billion across five main economic sectors; banking and financial services, insurance, investments, industry, and services. Most of the listed companies are profitable and trading in Jordanian Dinar, while others trade in US Dollars (PEX 2015).

### 2.3.1.1 Trading

The first trading session was held at the "PEX" on 18/02/1997. Since its launching, the "PEX" depends on electronic trading and clearing, depository, and settlement systems. In this sense, the "PEX" is considered the pioneer securities market in the region that adopted the automation of all its processes related to trading, and clearing, depository and settlement. At present, the "PEX" is adopting the horizon system supplied by OMX company as a trading system. In addition, it is adopting surveillance system called "Smarts" system (PEX 2015).

Figure (2.8): Number of listed companies \& Market Capitalization from 19972015.

### 2.3.1.1.1 Characteristics of Electronic Trading System

Orders are being executed according to the following criteria (PEX 2015):

- Price
- Time
- Remote trading is being conducted through brokerage firms and their branches.
- Trading is being conducted in more than one currency. Currently, trading is executed by the Jordanian dinar (JD) and United Stated Dollar (USD).
- The system saves data electronically, which enables to retrieving and looking into all movements that were carried out on that date.
- Trading is directly linked, tightly coupled, with the Clearing, Depository and Settlement Center (CDS) System. All trades are reflected directly on the investors' accounts, verify that their shares balances are available before any sell order is entered and to make sure that ownership ratio is not exceeded.

### 2.3.1.1.2 Trading Days and Times

- Trading is carried out daily from Sunday until Thursday every week.
- Trading is not carried out on: weekends (Friday and Saturday), official holidays.
- Scheduled trading session will be cancelled if the ratio of member firms is unable to connect and trade for $35 \%$ or more of the total number of member firms.
- Trading session starts at 09:45 and finishes at 13:30 (PEX 2015).

### 2.3.1.1.3 Trading Rules

Price limits, up and down, are (7.5\%) for shares listed in the first market, and (5\%) for shares listed in the second market and bonds (PEX 2015).

### 2.3.1.1.4 Trading Unit

The minimum limit of the number of shares and bonds allowed for trading (buy/sell) at "PEX" is one for all traded shares and bonds (PEX 2015).

### 2.3.1.1.5 Trading Surveillance

Trading Surveillance is based on regulations related to securities, which are applicable in Palestine; these are Securities Law No. (12) of the year 2004, Companies Law No. (12) of the year 1964, Securities Trading Regulation, rules, instructions issued in their accordance, and instructions issued by the Capital Market Authority. The SMARTS System is adopted to carry out the functions of trading surveillance. The Trading Surveillance System monitors the trading session instantly to detect any unusual behaviors of prices or trading volumes by making comparisons between the electronic information of the trading session and the standards adopted by the system so that an alert triggered when any standard is violated. Any violation is subject to the adopted charter of penalties and fines (PEX 2015).

. Figure (2.9): Number of transactions, traded volume and traded value from 1997-2015

### 2.3.1.2 Al Quds Index

In July 1997, "PEX" adopted a record for measuring stock prices levels and determining the general direction of these prices known as "Al Quds Index". The closing prices of 7/7/1997 were adopted to be the basis to set the value of the base for Al Quds Index of 100 points. The adjusted list of companies to be included in its Al-

Quds index for the year 2015. "PEX" raised the number of companies included from 12 to 15 to reflect the increase in the number of listed companies. Al-Quds sample for the year 2015 is as follows (PEX 2015):

- Palestine Development \& Investment - PADICO (Investment)
- Palestine Industrial Investment - PIIC (Investment)
- Palestine Real Estate Investment - PRICO (Investment)
- Arab Islamic Bank - AIB (Banking \& Financial Services)
- Bank of Palestine - BOP (Banking \& Financial Services)
- Palestine Islamic Bank - ISBK (Banking \& Financial Services)
- The National Bank - TNB (Banking \& Financial Services)
- Al-Quds Bank - QUDS (Banking \& Financial Services)
- National Insurance - NIC (Insurance)
- Palestine Telecommunications - PALTEL (Services)
- Palestine Electric - PEC (Services)
- Wataniya Palestine Mobile Telecommunications - WATANIYA (Services)
- Birzeit Pharmaceuticals - BPC (Industry)
- Jerusalem Cigarettes - JCC (Industry)
- Jerusalem Pharmaceuticals - JPH (Industry)

Figure (2.10): Daily average turnover transaction, daily average turnover volume and daily average turnover value from 1997-2015

At the end of every year, the companies that are included in Al Quds Index are assessed since the sample is modified in accordance with the trading statistics of that year. The following criteria are adopted (PEX 2015):

- Trading volume.
- Trading Value.
- Number of trades.
- Number of trading days.
- Market Value.

| 2003 | 27 | 223 | 40,304,432 | 58,280,758 | 10,552 | 180,737 | 261,349 | 47 | 655,463,931 | 179.81 | 18.95\% |
| 2004 | 27 | 244 | 103,642,845 | 200,556,709 | 27,296 | 424,766 | 821,954 | 112 | 1,096,525,380 | 277.56 | 54.36\% |
| 2005 | 28 | 246 | 369,567,295 | 2,096,178,223 | 166,807 | 1,502,306 | 8,521,050 | 678 | 4,457,227,305 | 1128.6 | 306.61\% |
| 2006 | 33 | 237 | 222,689,351 | 1,067,367,951 | 150,592 | 935,670 | 4,484,739 | 633 | 2,728,811,088 | 605 | -46.39\% |
| 2007 | 35 | 247 | 299,422,814 | 813,469,090 | 157,300 | 1,207,350 | 3,280,117 | 316 | 2,474,679,018 | 527.26 | -12.85\% |
| 2008 | 37 | 242 | 339,168,807 | 1,185,204,211 | 152,319 | 1,390,036 | 4,857,394 | 624 | 2,123,057,098 | 441.66 | -16.23\% |
| 2009 | 39 | 246 | 238,877,373 | 500,393,398 | 88,838 | 971,046 | 2,034,120 | 361 | 2,375,366,531 | 493 | 11.62\% |
| 2010 | 40 | 249 | 230,516,370 | 451,208,529 | 82,625 | 925,768 | 1,812,082 | 331 | 2,449,901,545 | 489.6 | -0.69\% |
| 2011 | 46 | 248 | 184,544,375 | 365,648,216 | 61,928 | 744,131 | 1,474,388 | 250 | 2,782,469,900 | 476.93 | -2.59\% |
| 2012 | 48 | 249 | 147,304,208 | 273,440,441 | 41,442 | 591,583 | 1,098,154 | 166 | 2,859,140,375 | 477.59 | 0.14\% |
| 2013 | 49 | 241 | 202,965,939 | 340,774,269 | 44,425 | 842,182 | 1,414,001 | 184 | 3,247,478,385 | 541.45 | 13.37\% |
| 2014 | 49 | 245 | 181,545,154 | 353,917,125 | 41,257 | 741,000 | 1,444,560 | 168 | 3,187,259,624 | 511.77 | -5.48\% |
| 2015 | 50 | 246 | 175,229,463 | 320,388,213 | 31,014 | 705,304 | 1,302,391 | 126 | 3,339,196,379 | 532.73 | 4.10\% |

the highest figure was in 2005 with $369,567,295$ shares. The Trading value rose from $25,181,030$ in 1997 to $320,388,213 \$$ in 2015 while it peaked the greatest number in 2005 with $2,096,178,223 \$$. The numbers of transactions were 1,957 and 31,014 in 1997 and 2015 respectively, during that time the highest record was in 2005 with 166,807 . The daily average turnover volume was 151,523 and 705,304 in 1997 and 2015 respectively while it peaked $1,502,306$ in 2005 . The daily average turnover transactions were 30 in 1997 and 126 in 2015, once again, and the 2005 was highest with 678. The market capitalization increased from 510,036,142\$ (in 1997) to $3,339,196,379 \$$ (in 2015). Al-Quds Index was 139.13 in 1997 and 532.73 in 2015 while it was 1128.6 in 2005. The Growth of Al-Quds index was $39.13 \%, 306.61 \%$, and $4.10 \%$ in 1997, 2005, and 2015 respectively (PEX 2015).

### 2.3.4 macroeconomic and stock market relation

The change in macroeconomic variables can significantly impact stock price return, many studies found a significant relationship between macroeconomic variables and stock market performance. Talla (2013) found that inflation and currency depreciation have a significant negative influence on stock prices. In addition, interest rate is negatively related to stock price change. Pathan and Masih (2013) reconfirmed the traditional belief that the real economic variables continue to affect the stock market in the post-reform era in India and also highlights the insignificance of certain variables with respect to stock market. Humpe and Macmillan (2009) found that stock prices are influenced positively by industrial production and negatively by the money supply.

## Part (4) <br> Palestinian local newspapers

### 2.4.1 Palestinian local newspapers

The emergence of the Palestinian press associated with the emergence of the press in other Arab countries, but the Palestinian press did not develop during the second half of the nineteenth century, so The Palestinians rely on the Syrian, Lebanese and Egyptian newspapers, which preceded Palestinian newspapers.

Most of the studies about the history of the Palestinian press found that the beginning of the Palestinian press was in 1876, where Al-Quds Al-Sharif newspaper was published for a first time in this year in Arabic and Turkish because Palestine was under the supervision of the Ottoman government. It was the first official newspaper, and could be considered a government representative and published on a monthly basis.

Since its inception, the Palestinian press passed through many different phases which affected by political, social, military, and various successive conditions on Palestine. Therefore, the dominant feature of the Palestinian press is mass mobilization, incitement and defending the land. The Palestinian press has gone through five stages starting from the Ottoman era to the present day:

1. The first stage: the stage of growing up under the Ottoman government, and extends from 1876 to 1918.
2. The second stage: The British Mandate period, and extends from 1918 to 1948.
3. The third stage: West Bank and Gaza Strip undergo to the supervision of Jordan and Egypt, and extends from 1948 to 1967.
4. The fourth stage: the stage of the Israeli occupation, and extends from1967 to 1994.
5. The fifth stage: the stage of the Palestinian National Authority, and extends from 1994 until now.

Because the study extends from 2011 to 2014, and this period lays completely inside the fifth stage "the stage of the Palestinian National Authority", in addition there was no stock market in Palestine before this stage. Therefore, the study will focus here on this stage in the following paragraph, and neglect the remaining stages.

With the coming of the Palestinian National Authority to the homeland, in 1994, the Palestinian people moved to a new stage of their history, the Palestinian National Authority beliefs in the role of the media and the press in the liberation struggle and survival, so it work for regulate press and publications law, which regulates the relationship between Authority and the press organizations. The press idea began to shape under the Palestinian Authority, which began to give licenses for the issuance of newspapers; the first issued newspaper was "Palestine", which was issued on 23 September 1994 by "Tahir Shuraiteh". But it did not stay long; only 14 issues were published and then stopped. In 10 November 1994, "Al-Hayaa AlJadeda" newspaper has been issued, which were close to the government, the chief editor was "Hafez Barghouthi", and the director "Nabil Amr", and it began a weekly and then turned daily. In 8 December 1994 "Al-Watan" newspaper has been issued, but the authority, for political reasons, closed it, "Al-Esteqlal" newspaper was established in 1995. At the end of 1995, two newspapers were established, "AlBelad" and "" and were daily published, but "Al-Belad" turned weekly later. In that time interval, the Palestinian Authority issued several newspapers and magazines, such as "Al-Aqsa", "Al-Sahel", "Al-Zaytona", "Al-Ray", "Al-Sabah" and other newspapers that need mentoring and training.

### 2.4.2 Al-Hayaa newspaper

"Al-Hayaa Al-Jadeda" Newspaper was established on 10 September 1994, at the beginning, it was published as a weekly political newspaper, and since 19 August 1995, it was turned to daily newspaper. The researcher will use the short name "AlHayaa" to denote the newspaper for more ease.
"Al-Hayaa Al-Jadeda" represents the authority to some extent, and this situation is clear in the founding statement of the newspaper which states that "We are with the authority to success the historical opportunity of building a society and independent national entity, but we will not stand silent with what we see negligence or breach in the structure, views, and will address issues related to authority with a high degree of sensitivity and responsibility in order to development, not Obstruction and drag the cart to the back."
"Nabil Amr" established "Al-Hayaa Al-Jadeda", and he was a general manager of the newspaper before its ownership transferred to the Palestine

Investment Fund. The newspaper relies on the advantage of the creative skills from outside the newspaper owners, to enrich the daily issues and various articles and comments content.
"Al-Hayaa Al-Jadeda" is usually issued in 28 page, it issued with many of the supplements, including:

- Life issues supplement, issued on Saturday.
- Sport supplement, issued on Tuesday.
- Cultural supplement, issued on Thursday.

Some of these supplements stopped, and some appears from time to time. The number of "Al-Hayaa Al-Jadeda" newspaper staff is (60) employees officially distributed among reporters, editors, and administrators.

### 2.4.3 Al-Ayyam newspaper

It is an independent political daily newspaper published by organization for Press, Printing, Publishing, and Distribution" in Ramallah. organization is a private owned company. The first issue of newspaper was published on 25 December 1995. newspaper was launched by the efforts of staff from the energies youth and promising, and competencies of the brightest group of diaspora journalists and writers, who returned home after the signing of the Oslo agreement. The writer "Akram Haniyeh" is the chief editor, and "Ghassan Al-Damen" is the chair of board of directors.

The number of pages ranges from 20 to 40 classified, distinct, and output dynamic pages, they include economic, sporting, cultural topics; and cover national, regional and international news, and sometimes, there is selected topics from the Hebrew press.

### 2.4.4 Felesteen newspaper

"Felesteen" is a daily comprehensive political newspaper, which issued in Gaza City by "Al-Wasat" company for media and publishing (LTD Co.). The newspaper got the license from the Ministry of media on 16 September 2006. The first issue of the "Felesteen" newspaper was published on 3 May 2007. "Felesteen" newspaper aims to achieve a set of objectives, including:

- Providing the press service for the first time in the Gaza Strip.
- Contribute to raising the level of thinking and knowledge of the Palestinian people through the study of the Palestinian situation in a scientific manner.

The contents of "Felesteen" newspaper depends on the following determinants and features:

- Respect others' opinions and avoid offending to individuals and institutions.
- Reliance on evidence and documentation proof, and do not charge the lump without evidence.
- Taking into account assets, ethics, the rules of journalistic work and the Palestinian press laws.
- Consolidating on the meanings of the Palestinian national unity, dialogue and mutual respect.
- The defense of the legitimate rights of the Palestinian people, and their national constants.

In this study, the researcher will take three of main local newspapers, AlHayaa, Al-Ayyam, and Felesteen. Although Al-Quds newspaper is the most important one, but the difficult of getting soft copied prevented the researcher form inserting it into the sample. In addition, although Felesteen newspaper is considered emerging newspaper, and it is distributed in Gaza strip only, but the researcher inserted it into the sample in order to make a balance between the two side of the country, because it's the most widespread in Gaza strip, in the same time, Al-Hayaa was prevented in Gaza strip because of political division.

### 2.4.5 Main parts of newspapers content

The study has already mentioned that, in this study, the researcher will analyze the economic content of local newspapers, but it is a good idea before focusing on the economic content, to take an overview on the content of newspapers in general. In general, there is a kind of stereotype that can be tracked in the basic components of the newspapers, but this does not mean lack of some additions or modifications that occur from time to time on the content, with the stability of the main components in the long term. the following paragraphs explains the feature and main elements in the full issuance of each newspaper.

### 2.4.5.1 Al-Hayaa newspaper:

In the majority of days, the total number of pages ranging from 20 to 28 pages, but in a few cases, the number drops to reach 16 pages only, or rises up to reach 44 pages, so the researcher excluded these few cases, and focused on the vast majority, which ranging between 20 to 28 pages. When the number of pages is about 20 pages, it is often on Saturday and Sunday, a couple of days that no trading on the previous day, and therefore there is no economic pages on them, and in those days, the content of the newspaper consists of the following sections:

1. Cover page: Contain the most important events of the previous day and include (News, comments, national activities and events, receiving representatives and diplomatic visits,) include all levels, local, Arab and international, and it fails to address the economic side. The page often contains part of the article or news stories, and the sequel comes in an inside dedicated page.
2. Local section: Often consists of 8 pages contain political news, events, and comments, and national issues, such as: Citizens arrested by the Israeli occupation forces, Injures in confrontations with Israeli occupation forces, and Attacks by Settlers against Palestinian people and their farms. Advertisements for government agencies, organizations, and sometimes, trading companies, permeates these pages at the bottom part.
3. Arabian and International section: Often it consists of two pages encompass the Arab and international political news.
4. Sequel page: to complete the articles and news that has been referred to in the cover page.
5. Opinion page: One page often contains some caricature drawings that reflect the current situation, as well as some press articles about topical issues.
6. Sport section: Often this section consists of four pages containing the local, Arab and international sports news.

The remaining pages include entertainment topics such as fashion, health and beauty, new technologies, art and cultural news, and commercial advertising. In the other days, except Saturday and Sunday, the number of pages are often 24 or more, and the following sections are added to the above:

1. Economic section: Usually consists of 2 to 4 pages and contain economic news and articles and this section content will be explained in detail later.
2. Israeli affairs: It consists of a page to two pages and contains selected articles from Israeli newspapers such as (Haaretz, Yediot, Maariv) translated to the Arabic language.

The remaining pages contain more of commercial advertisements, more of entertainment which include (crossword, happened on this day, horoscope and luck, some entertaining games), and the number of sports pages may increase up to 6 in some cases.

### 2.4.5.2 Al-Ayyam newspaper:

Although, there is a similarity, to some extent, between and Al-Hayaa newspaper in the main parts of content, the total number of pages is larger in the case of Al-Ayyam. The total number of pages ranging from 32 to 36 pages, but in a few cases, the number drops to reach 20 or 24 pages only, especially on Fridays, or rises up to reach 40 pages. At the majority of days, the content of the newspaper consists of the following sections:

1. Cover page: It similar to Al-Hayaa newspaper, contain the most important events of the previous day from all levels, local, Arab, and international, and it fails to address the economic side. The cover page often contains part of the article or news stories, and the sequel comes in an inside dedicated page.
2. Local section: Often consists of 10 pages contain political news, events, and comments, and national issues.
3. Arabian and International section: Often it consists of $2-3$ pages encompass the Arab and international political news.
4. Press panorama: from 2-3 pages contains selected articles from Arab and international newspapers translated to the Arabic language.
5. Sequel page: from 1-2 pages to complete the articles and news that has been referred to in the cover page.
6. Economic section: Usually consists of 2 to 4 pages and contain economic news and articles and this section content will be explained in detail later.
7. Miscellany and entertainment: this section comes under (Al-Dewan) and "Shababeek" titles, and consists of 2-3 pages contain fashion, health and beauty, new technologies, art and cultural news.
8. Sport section: Often this section consists of 4-6 pages containing the local, Arab and international sports news.

When the number of pages increases, it the additional pages contain commercial advertisements, caricature drawings and opinion pages, and sometimes a page or two for cultural topics.

### 2.4.5.3 Felesteen newspaper:

Felesteen newspaper is considered the most stability one in terms of the total number of daily pages, where the number is constant to a large extent throughout the study period, and has not changed except only once after the Israeli aggression on Gaza Strip (July and August 2014). The newspaper headquarters was bombed by Israeli warplanes during the aggression resulting in a massive destruction in it. Since the beginning of 2011 until the Israeli aggression on 7 July 2014, the number of daily page was, to a large extent, constant at 32 pages a day, but after the end of the aggression, it has become, to a large extent, constant at 28 pages a day.

The content of Felesteen is similar to the content of the other two newspapers the in several sections, such as cover page, local section, Arab and international section, sequel page, economic section, and sport section, but with some differences in the number of pages in each section (11 pages for local section, 4 pages for Arab and international section, 1-2 pages for economic section, 4 pages for sport section, and 2-3 pages for opinion and dialogue. In addition, there are two sections do not exist in the other two newspapers:

1. Family and community section: consists of 2 to 3 pages that discuss family and community issues, such as child rearing, safe nutrition, health, and social issues.
2. Religious section: consists of a single page containing some religious issues and answers to readers' questions.

From the previous indicators, it can be seen that the media coverage to the economic sector is limited and weak in the three newspapers. The total number of economic pages in the three newspapers reached to 8,666 pages only throughout the study period which extends to 1,461 days, this means that economic sector has an
average of less than 6 pages per day in the three combined newspapers, and less than 2 pages per day in each newspaper alone, while the sport sector up to 4 and sometimes 6 pages a day in each newspaper alone, in addition, entertainment and games up to 2 pages a day also.

### 2.4.6 Main parts of newspapers economic content

This section provides a descriptive analysis to the content of the economic pages in the three newspapers, which is likely to be representative of most of the coverage of the corporate sector. In each newspaper, the researcher explains and comments on the detailed statistics, describe the common fixed topics, and show the tone by which the pages were written.

### 2.4.6.1 Al-Ayyam newspaper

newspaper characterized with the highest rate of economic pages and covered days between the three newspapers in the sample. The total number of covered days during the four years is 1,440 days, which represent $98.56 \%$ of the total days, and it is almost equally distributed between the four years. At the same time, the number of economic pages increases from 686 pages in 2011 to 973 pages in 2014.

The content of Al-Ayyam is somewhat similar to Al-Hayaa; the main parts of the daily content of the two newspapers are as the following:

## 1. Trading bulletins:

Trading bulletins is a table contains all the quantitative information about the previous trading day for all listed companies. Such information includes prices, trading volume and value, exchanging currency, change percentage, and the number of transactions.

Under this table, there are two small tables. The first table contains four overall statistics on the market during the previous day, these statistics are:

- Number of companies, which stock has been traded
- Number of companies that share prices, have risen
- Number of companies that share prices have declined
- Number of companies that share prices have not changed

The second table contains numerical data about the seven indices, Al-Quds index, General index, and one index for all economic sector.

In the bottom of this section, there is a qualitative description essay about the market and the index's performance with some percentage statistics and rate.

Figure (2.12) a sample of daily bulletins at newspaper.

## 2. Local economic news:

This section includes news, articles, press reports and investigations about the local economy. These news and articles may be categorized into the main following scopes:

- Listed company's news, including disclosure of information, shareholder meetings, Dividends to shareholders, Launch new services, marketing and promotional campaigns.
- Projects that have an Economic influence such as hospital and school building, roads and Infrastructure, and development of the agricultural and industrial sector.
- Variables of the local macroeconomic such as inflation, poverty and unemployment rates, exports and imports, foreign funds and aid, and living expense.
- Economic events such as conferences, exhibitions, seminars and workshops, signing of agreements to implement projects, and visiting of foreign delegations.
- Laws and regulations related to the economy, such as taxes, customs, and unions and labors.
- Present results of some economic researches and studies.

## 3. Regional economic news:

Its amount is less than local news and it includes:

- Information about some of the Arabian stock market indices, especially in Kuwait, Saudi Arabia, Jordan, Egypt, Qatar, United Arab Emirates.
- Oil and natural gas prices, supply, demand, and production quantities of them.
- Trade exchange among Arab countries.
- Political events that influence the economy, such as strikes and protests.
- Foreign investments in Arab countries.
- Debt and loans for countries and the Arab governments.

## 4. Global economic news:

Such news centered on imports and exports, economic growth, debt, and news about international companies in the areas of technology, automotive industry, and energy.

### 2.4.6.2 Al-Hayaa newspaper

The total number of covered days during the four years is 1,029 days, which represent $70.43 \%$ of the total days, and it is almost equally distributed between the four years. 2014 has the largest number of economic pages compared to the previous three years.

The content of Al-Hayaa economic pages is quite similar to those of newspaper. The most important differences between them can be summarized in the following points:

1. Often there was no economic pages in the days that following the non-trading days, Saturday and Sunday, while in Al-Ayyam newspaper, there were economic pages, but without trading bulletin.
2. Bulletin of Currency exchange rates, Precious metals prices, the currencies included in the table are US dollar, Jordan dinar, euro, and Sterling pound, and the metals are gold and silver. Figure (2.13) show a sample of this bulletin.
3. Weekly business supplement was published during the period from 18 April 2011 to 20 November 2011. The newspaper published 29 volumes from the supplement under the title of "life and market". The supplement often consists of 10-16 page and covers economic field only.

Figure (2.13): bulletin of Currency exchange rates and Precious metals prices sample.

### 2.4.6.3 Felesteen newspaper

The total number of covered days during the four years is 1,293 days, which represent $88.50 \%$ of the total days. It is noted that the number of covered days increases from 291 days in 2011 to 360 days in 2013, then significantly decreased to 307 days in 2014 Due to stop publishing the newspaper during the period of the Israeli aggression on Gaza Strip summer of 2014. The number of economic pages also increased from 519 pages in 2011 to 689 pages in 2013, and then significantly decreased to 601 pages in 2014 because of the same reason.

As I explained earlier, the economic content of the two previous newspapers is similar, at the same time, the economic content of Felesteen newspaper differs from them dramatically. The manner of discussing the economic issues tends to be general and descriptive rather than quantitative. In any case, the researcher can summarize the most important differences between Felesteen and the two previous newspapers in the following points:

1. The absence of trading bulletin shows the numerical trading data for all listed companies in the market through the previous days.
2. Focusing on the Israeli siege of Gaza Strip, this issue occupies a large part of the daily economic content of the newspaper, such news includes subjects as opening and closing crossings, the effects of the Israeli attacks and reconstruction projects, and service projects implemented by municipalities and local government bodies, and emergency crises such as fuel, gas, and electricity.
3. Focusing on local news in comparison to other newspapers.
4. As Felesteen newspaper during the study period issued only in Gaza without the West Bank, the news focused on the economy of the Gaza Strip more than the West Bank.

## Chapter 3

## Literature Review

## Chapter 3

## Literature Review

### 3.1 Introduction

This chapter reviews 30 previous studies, which are related to the study. 18 of them have been conducted in USA financial market, 3 in Germany, 1 in UK, France, Argentina, New Zealand, and Netherlands, and 3 in two or more countries. Figure (3.1) shows the distribution of the reviewed studies on the different markets.

The reviewed literature varies in the covered period, the media sources, the covered firms, the frequency of measurements, the methodology, and the results. They can be classified in more than category such as the period of the study, the type of media, the covered firms, the frequency of measurements, and the media tone measurements approach. The longest time series in the literature extends for 100 years, when Garcia (2014) analyzed the newspapers content from 1905 to 2005. The shortest time series extends for 4 days only, Chung and Liu (2011) analyzed the twitter content from 29 November 2011 to 2 December 2011. Except Sprenger and Welpe (2011) and Bollen, Mao et al. (2011) which are extend for less than one year, the remain studies of literature varies from 4 to 37 years. Figure (3.2) segments the studies according to the duration period of each study into 6 categories as follow: less than on year, from 1 to 5 years, from 6 to 10 years, from 11 to 15 years, from 16 to 20 years, and more than 20 years. The figure also shows the number of studies in each category.

Figure (3.1) show the number of study in each country

Figure (3.2): the number of studies in each duration period category.
The main media sources can be categorized into three main sources: newspaper articles, annual reports required by the U.S. Securities and Exchange Commission (SEC) such as $10-\mathrm{K}$, and social media articles and comments. 25 studies in the literature use newspaper articles in different formats, hardcopies, soft copies and online news. 3 studies use twitter content, one study uses Seeking Alpha (SA), one of the biggest investment-related social-media websites in the United States, and one study uses $10-\mathrm{K}$ annual report. Chen, De et al. (2014) combined between articles from Dow Jones newspaper and Seeking Alpha (SA) articles. Schmitz (2007) used 7 TV news in addition to articles from 5 large daily newspapers. The most newspapers that has been analyzed in the literature is Wall Street Journal (WSJ) and Dow Jones (DJ).

Most important works of literature study the effect of media content on a set of firms listed in a specific index/ indices.

Some studies depend on stocks form one index, For example, Tetlock (2007) depended on Dow Jones Industrial Averages (DJIA) and Ferguson, Philip et al. (2014) depended on FTSE 100 firms (the Financial Times Stock Exchange 100 Index). Some studies depended on stocks from two or more indices, such as Akbas, Kocatulum et al. (2008) which depended on all stocks traded on NYSE, AMEX and NASDAQ indices, and Kerl, Schürg et al. (2014) which depended on German DAX, MDAX and SDAX indices. Some studies selects a set of stock such as Chen,

Pantzalis et al. (2009) which depended on top gainers and top losers of ten companies in the technology sector.

The researcher means by the frequency the period of observing the value of variables, the major of the literature used daily or monthly base. Some studies analyzed the variable relations at a daily base; in this case, they used high frequency measurements. Other studies analyzed the variable relations at a monthly base; in this case, they used low frequency measurements. Just Sinha (2010) used weekly base, Fang, Peress et al. (2014) and Chen, De et al. (2014) used quarterly base, Some studies combine between two bases, analyzed each variable at one base such as Jegadeesh and Wu (2013) which used annually base in addition to monthly base.

The table is classified into four panels, the first is fore USA studies and contains 19 studies, the second is for Europe and contains 6 studies, the third is for emerging countries and contains 2 studies, and the last panel for international and contains 3 studies.

Table (3.1): brief summary about the literature study.

| \# | name | authors | time period | media source | stock data | interval | tone measurement |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| USA studies |  |  |  |  |  |  |  |
| 1 | Giving content to investor sentiment | Tetlock, P. C. (2007) | 1984-1999 | Wall Street Journal's (WSJ's) <br> "Abreast of the Market" column | Dow Jones Industrial Averages | daily | Counting the words <br> in all 77 <br> predetermined GI categories from the Harvard psychosocial dictionary. |
| 2 | More than words: Quantifying language to measure firms' fundamentals | Tetlock, P. C., et al. (2008) | 1980-2004 | Wall Street Journal (WSJ) and Dow Jones News Service (DJNS) | Center for Research on Security Prices (CRSP) for S\&P index stocks | daily | Bag-of-Words scheme <br> Harvard-IV-4 <br> psychosocial dictionary |
| 3 | Does Media Coverage of Stocks Affect Mutual Funds' Trading and Performance? | Fang, L. H., et al. (2014) | 1993-2002 | four daily newspapers: USA Today, The Wall Street Journal, The New York Times, and The Washington Post | Nexis Lexis for all NYSE stocks and 500 randomly selected NASDAQ stocks | quarterly | count the total number of articles about each firm in the sample |
| 4 | Underreaction to news in the US stock market | Sinha, Nitish <br> Ranjan (2010) | 2003-2010 | wire service from the Thomson Reuters NewsScope dataset | Center for Research in Security Prices (CRSP) tapes provided through the Wharton research data services (WRDS) | weekly | Analyzing a document at the sentence level |
| 5 | Financial Press Coverage and Expected Stock Returns | Christopher Gadarowski (2002) | 1980-1995 | Dow Jones News Service | New York Stock Exchange (NYSE) and American Stock Exchange (AMEX) nonfinancial firms | annually and monthly | count of Dow Jones News Service documents using a ticker search |

| \# | name | authors | time period | media source | stock data | interval | tone measurement |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6 | Word Power: A New Approach for Content Analysis | Narasimham Jegadeesh, Di Wu (2011) | 1995-2008 | 10-Ks filed from SEC's EDGAR database using a customized web crawling algorithm | almost 2,914 every year in the period | annually | negative and positive word lists constructed by Loughran and McDonald (2011) |
| 7 | Media Coverage and the Crosssection of Stock Returns | Fang, L. and J. Peress (2009) | 1993-2002 | Four daily newspapers: New York Times (NYT), USA Today (USAT), Wall Street Journal (WSJ), and Washington Post (WP). obtained from LexisNexis | (CRSP) for all companies listed on the NYSE and 500 randomly selected companies listed on the NASDAQ | monthly | eighted sum of articlespublished about each company in each month |
| 8 | Journalists and the Stock Market | Casey Dougal, Joseph Engelberg, Diego Garcia, and Christopher A. Parsons | 1970-2007 | Wall Street Journal | Dow Jones Industrial Average (DJIA) | daily | Loughran and McDonald (2009) |
| 9 | Media and Investment Management | Gideon Ozik and Ronnie Sadka (2012) | 1999-2008 | Three main categories: General (daily newspapers); Specialized (investment magazines); and Corporate communication (PR Newswire and Business Wire). | 774 unique funds includes both operating, "Live" funds and "Graveyard" funds | monthly | Textual analysis to the title of each news item to measure news item sentiment. classifies each word into positive, negative, or undefined, according to the Harvard IV-4 Psychosocial Dictionary |
| 10 | Mispricing following public news: Overreaction for loser, underreaction for winners | Ferhat Akbas, Emre Kocatulum, and Sorin M. Sorescu | 1980-2006 | news items obtained from Dow Jones Interactive Publications Library of past newspapers | all stocks traded on NYSE, AMEX and NASDAQ | monthly | Chan (2003) |

| \# | name | authors | time period | media source | stock data | interval | tone measurement |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 | News versus sentiment: Comparing textual processing approaches for predicting stock returns | Steven L. Heston, and Nitish Ranjan Sinha | 2003-2010 | Thomson-Reuters neural network. | tagged firm identifiers from the Thomson-Reuters news system over the calendar years | daily and weekly | Harvard psychosocial dictionary used by <br> Tetlock, Saar- <br> Tsechansky, and <br> Macskassy (2008), the financial dictionary of Loughran and <br> McDonald (2011), and a proprietary ThomsonReuters neural network |
| 12 | Predicting Stock Market Fluctuations from Twitter | Sang Chung \& Sandy Liu | 2011 <br> (November 29, to December 2) | tweets in XML format | Top gainers and top losers of ten companies in the technology sector Google stock prices | daily | Hu and Liu's sentiment list contains about 6800 words that reflect either positive or negative sentiment |
| 13 | Press Coverage and <br> Stock Prices' <br> Deviation from <br> Fundamental Value | CW Chen, C Pantzalis, JC Park | 1995-2004 | major U.S. newspapers (Wall street Journal, New York Times, Washington Post, and Los Angeles Times) | CRSP) where NYSE, AMEX, and Nasdaq stocks are listed | monthly | count of the number of newspaper articles on a particular firm |
| 14 | Stock price reaction to news and nonews: drift and reversal after headlines | Wesley S. Chan | 1980-1999 | Dow Jones Interactive Publications Library | A subset of CRSP stocks randomly selected approximately $1=10$ th of all stocks that existed at any time | monthly | For each company, he select all dates when the stock was mentioned in the headline or lead paragraph of an article |
| 15 | The causal impact of media in financial markets | Joseph Engelberg Christopher A. Parsons | 1991-2007 | articles from newspapers: Boston (Globe), Denver (Post), Detroit (News), <br> Houston (Chronicle), Las Vegas (Review Journal), New York (Times), etc | S\&P 500 Index firms | daily | database of newspaper articles <br> linked by GVKEYs to S\&P 500 firms |

| \# | name | authors | time period | media source | stock data | interval | tone measurement |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 16 | The kinds of financial journalism | Diego Garcia | 1905-2005 | Wall Street Journal and New York Times | DJIA returns | daily | positive and negative word counts using the word dictionaries provided by Bill McDonald |
| 17 | News or noise? The stock market reaction to different types of companyspecific news events | Timm O. <br> Sprenger <br> Isabell M. Welpe | January 1st and June 30th, 2010 | microblogging platform Twitter | S\&P 500 stock prices | daily | Naïve Bayesian classification method, the most widely used algorithms for supervised text classification |
| 18 | Wisdom of crowds: the value of stock opinions transmitted through social media | Hailiang Chen, Prabuddha De, Yu (Jeffrey) Hu, and Byoung-Hyoun Hwang | 2005-2012 | Seeking Alpha (SA) articles, SA commentaries, and DJNS articles | IBESCOMPUSTAT CRSP | quarterly | negative words list compiled by Loughran and McDonald (2011) |
| 19 | Twitter mood predicts the stock market | Johan Bollen; Huina Mao ,XiaoJun Zeng. | February 28 to December 19th, 2008 | Twitter | Dow Jones Industrial Average (DJIA) | daily | two mood tracking tools, OpinionFinder and GPOMS |
| Europe studies |  |  |  |  |  |  |  |
| 20 | Do Newspaper Articles Predict Aggregate Stock Returns? | Manuel Ammann, Roman Frey, and Michael Verhofen (2011) | 1989-2011 | articles published in the Handelsblatt a leading German financial newspaper | main stock market index DAX | monthly | word-count indices, a list of words frequently used in newspaper articles |

| \# | name | authors | time period | media source | stock data | interval | tone measurement |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 21 | Market and Individual Investors Reactions to Corporate News in the Media | Philipp Schmitz <br> (2007) | 1998-2006 | 5 large daily newspapers and 7 <br> TV news | 125 large (DAX) and medium-sized (MDAX)companies | daily | Media Tenor, a media research institute that screens the opinion leading daily newspapers and TV news with the help of 240 media analysts. |
| 22 | The impact of Financial Times Deutschland news on stock prices post announcement drifts and inattention of investors | Alexander Kerl1 Carolin Schürg Andreas Walter | 2006-2010 | Financial Times Deutschland (FTD) news | German DAX, MDAX and SDAX companies | daily | Every single article is read by two of the authors and, classified as either positive or negative. Otherwise, they classify it as neutral |
| 23 | Media content and stock returns: The predictive power of press | Ferguson, N. J., et al. (2014) | 1981-2010 | national newspapers: The <br> Financial Times (FT), The Times, The Guardian and Mirror | FTSE 100 firms | daily | The words in each article are compared to Loughran and McDonald's (2011) positive and negative financial word lists |
| 24 | Media-Driven High Frequency Trading | Bastian von BeschwitzDonald <br> B. KeimMassimo Massa | 2004-2012 | RavenPack (Dow Jones Newswire) | CRSP | monthly | computer algorithm and delivers articlelevel relevance and sentiment metrics |
| 25 | The "Tone Effect" of News on Investor Beliefs: An Experimental Approach | Ronald Bosman, at al. (2014) | 1990-2010 | New York Times (NYT) or the Financial Time (FT) | selected twelve U.S. company stocks that were listed on the S\&P 500 index | monthly | 80 Master and Bachelor students from the Faculty of Economics and Business Administration at the VU University Amsterdam |
| Emerging studies |  |  |  |  |  |  |  |

| \# | name | authors | time period | media source | stock data | interval | tone measurement |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 26 | Media news and the stock market: evidence for Argentina | J. Daniel Aromí -IIEP-Baires | 1997-2012 | La Nacion, a major newspaper published in Buenos Aires | Merval Index, the main index reflecting stock prices in the Bolsa de Comercio de Buenos Aires | daily | lists of words with positive and negative valence, and use two categories from the Harvard IV-4 dictionary: Pstv and Ngtv. |
| 27 | Media Sentiment, Investor Sentiment, and Stock Price Sensitivity to Earnings | Steven F. Cahana, Chen Chena, Nhut H. Nguyenb | 2003-2011 | Thomson Reuters News Analytics | 125 portfolios returns as the benchmark following Daniel, Grinblatt, Titman, and Wermers (1997) | monthly | TRNA database of news items where each news item has been scored on three sentiment dimensions, positive, negative, and neutral |
| International studies |  |  |  |  |  |  |  |
| 28 | The role of media in the credit crunch: the case of the banking sector | Tomasz Piotr Wisniewski Brendan Lambe | 2005-2010 | all English language news contained in the LexisNexis database | FTSE Banks indices downloaded from DataStream | monthly | recorded the number of articles mentioning negatively charged phrases |
| 29 | The impact of the media in financial markets: evidence from newspaper strikes | Joel Peress | 1989-2010 | Newspaper articles | the media sector | daily | indicator variable which equals one if a newspaper strike occurs on day t zero otherwise |
| 30 | How important is the financial media in global markets? | Griffin, J. M., et al. (2011) | 2003-2009 | Factiva news archive which includes major business news publishers such as The Wall Street Journal, Financial Times, Dow Jones, and Reuters. | CRSP for the United States and from Thomson Financial's Datastream for the rest of the world | daily | Ratio of the number of articles in the earningsevent window relative to the number of articles in the pre-event window |

### 3.2 Newspapers based studies

In this section, the researcher will begin with the studies, which used newspaper articles to measure the tone, because it is similar to our study, and it represents the big size of the literature.

## 1. (Akbas, Kocatulum et al. 2008)"Mispricing following public news: Overreaction for loser, underreaction for winners."

This study examines the interaction of momentum and short-term reversal. The main dataset include all stocks traded on NYSE, AMEX and NASDAQ during the period from 1980 to 2006. The authors employ a news dataset assembled by Chan (2003), which covers a random sample of approximately one-quarter of all CRSP stocks over the period from 1980 to 2000. The authors divided stocks into two groups: Stocks that were mentioned in the headlines (the news group) based on Chan's dataset, and stocks that were not (the no-news group). They repeat their previous analysis with these two sub-samples. The study found under reaction to public news. These findings present opportunities for earning abnormal returns of a magnitude never before documented in the literature.

## 2. (Ammann, Frey et al. 2014) "Do newspaper articles predict aggregate stock returns?'

The goal of this study is to investigate the predictive power of newspaper contents toward stock market's future returns in Germany. The data about newspaper content was collected from articles published in the Handelsblatt, a leading German financial newspaper, from July 1989 to March 2011. These data were summarized and quantified by constructing word-count indices. The stock market data was collected from the main stock market index, the DAX price levels. The main finding of the study is that the predictive power of newspaper content has increased over time, particularly since 2000. In addition, a cluster analysis approach increases the predictive power of newspaper articles substantially. The analysis shows that newspaper content is a valuable predictor of future DAX returns in and out of sample. Finally, the study extended by analyzing the relation between newspaper articles and the development of Germany's real economy.

## 3. (Aromí-IIEP-Baires 2013) 'Media news and the stock market: evidence for Argentina."

This study provides evidence on the relationship between information flows and stock prices. it evaluates the relationship between media content and stock returns using daily data from Argentine press from 1997 through 2012. The author
implements a quantitative analysis of information flows that provides new evidence for an emergent market. The measure of information flow is taken from the economic section of La Nacion, a major newspaper published in Buenos Aires. The author identified lists of words with positive and negative valence, and use two categories from the Harvard IV-4 dictionary: Pstv and Ngtv. The analysis shows that a high faction of positive words and a low fraction of negative words predict higher returns for the following market session. The results are consistent with the presence of market participants that overreact to information flows and limits to arbitrage.

## 4. (Bosman, Kräussl et al. 2014)" The "tone effect" of news on investor beliefs: An experimental approach."

The study investigates the effect of the tone of news on investor stock price expectations and beliefs. In an experimental study, subjects were asked to estimate a future stock price for twelve real listed companies. The sample consists of 80 Master and Bachelor students from the Faculty of Economics and Business Administration at the VU University Amsterdam. The students were provided with historical stock prices and extracts from real newspaper articles. The authors selected twelve U.S. company stocks that were listed on the S\&P 500 index and that complied with their pre-specified performance requirements. The main results show that subjects on average seem to expect a significantly higher (lower) future return after reading positive (negative) tone news. The effect appears to be driven mainly by stocks with the poor past performance. Subjects, who tend to expect a higher (lower) next period stock return, also tend to describe their sentiment as more optimistic (pessimistic). Subjects are more likely to choose to buy (sell) additional shares after reading positive (negative) than negative (positive) tone news.

## 5. (Cahan, Chen et al. 2013)'Media sentiment, investor sentiment, and stock price sensitivity to earnings."

The study examines media optimism and pessimism in firm-specific news rather than focuses on market-wide investor sentiment. The authors construct a measure of firm-specific media sentiment (MediaSent) using data from TRNA. To examine the effect of media sentiment on the ERC from January 2003 to December 2011, they adapt MS's model and regress the CAR on indicators for good and bad earnings news, interactions between the good/bad earnings news indicators and firmspecific media sentiment in the month prior to the earnings announcement, investor
sentiment, and control variables. The findings show that the optimism (after controlling for firm fundamentals) in stories written by the business press can lead investors to overreact (underreact) to positive (negative) unexpected earnings, while pessimism can lead investors to overreact (underreact) to negative (positive) unexpected earnings.

## 6. (Chan 2003)'Stock price reaction to news and no-news: drift and reversal after headlines."

This study examines returns to a subset of stocks after public news about them is released. This subset of stocks is compared to other stocks with similar monthly returns, but no identifiable public news. The author collected all stocks in a given month that had an event of interest (in this case, at least one news story). Then he ranked all such stocks by raw returns and select the top and bottom thirds. Then he referred to these two sets as "news winners" and "news losers". Then he examined cumulative raw and abnormal returns for up to 36 months after the initial headline month. He also did the same for no-news stocks. The study found evidence of postnews drift, which supports the idea that investors underreact to information. This is strongest after bad news. The study also found some evidence of reversal after extreme price movements that are unaccompanied by public news.

## 7. (Chen, Pantzalis et al. 2009) "Press coverage and stock prices' deviation from fundamental value."

The study examines the potential link between abnormal press coverage and several mispricing measures. It tests the relation of press coverage with measures of risk associated with the information environment of the firm. The authors measure the extent of press coverage for a large sample of publicly traded U.S. firms by counting the number of news articles about every firm that appeared each calendar year from 1995 to 2004 in the four major U.S. newspapers (Wall street Journal, New York Times, Washington Post, and Los Angeles Times). The final sample includes 12789 firm-years during the sample period. They read each article to make sure whether it is about the particular firm and when it is reported. The empirical tests provided evidence against the information intermediary and corporate governance hypotheses. In particular, the study found that a) mispricing significantly rises with abnormal press coverage, and b) information risk measures are significantly positive related to abnormal news coverage. These two pieces of evidence, combined with the
fact that abnormal news coverage is also associated with greater trading volume, are consistent with the predictions of both the biased media and the media-induced sentiment hypotheses.

## 8. (Dougal, Engelberg et al. 2011)'Journalists and the stock market."

The main objective of this study is to investigate the relation between the writing of specific journalists and aggregate market outcomes. Two main data sources used in this study are the Abreast of the Market (AOTM) column from the Wall Street Journal, and the Dow Jones Industrial Average (DJIA) price and dividend series. The sample period spans January 1, 1970 to December 31, 2007. The results suggest that financial journalists have the potential to influence investor behavior, at least over short time horizons. Adding journalist fixed effects to a daily return regression significantly increases explanatory power, and when these fixed effects are interacted with recent returns, the implied return predictability is even more dramatic. Overall, the study results suggest that the interpretation of public news is important, as the uncovered effects are strongest when journalists write about significant market moves.

## 9. (Engelberg and Parsons 2011) 'The causal impact of media in financial markets."

The study aims at solving the problem of separating the causal impact of media reporting and the impact of the events being reported by comparing the behaviors of investors with access to different media coverage of the same information event. The authors use zip codes to identify 19 mutually exclusive trading regions, corresponding to 19 large U.S. cities and local newspapers. The data divides into three types: earnings announcements, local media coverage, and trading of retail investors. The authors collect all earning announcements dates from S\&P 500 firms between January 1991 and December 2007. The main result is that for an earnings announcement by a given S\&P 500 Index firm, trading in each of the nineteen local markets is strongly related to whether the local paper covers the announcement. All else equal, local press coverage increases the trading volume of local retail investors by nearly $50 \%$. Although somewhat stronger for buying activity, the local media-local trading effect remains significant for selling as well.

## 10. (Fang, L., \& Peress, J. 2009)'Media coverage and the cross section of stock returns."

This study investigates if the mass media can alleviate informational frictions and affect security pricing even if it does not supply genuine news by studying the
cross-sectional relation between media coverage and expected stock returns. This study counts articles in mass-circulation newspapers and focuses on coverage. The sample consists of all companies listed on the NYSE and 500 companies were randomly selected and listed on the NASDAQ between January 1, 1993 and December 31, 2002. The main finding are: stocks not covered by the media earn significantly higher future returns than stocks that are heavily covered, even after accounting for widely accepted risk characteristics. The return difference is particularly large among small stocks, stocks with low analyst coverage, stocks primarily owned by individuals, and stocks with high idiosyncratic volatility. In particular, the media effect is strong among small stocks and stocks with high bidask spreads. Also the study found that the no-media premium is particularly large among stocks that face the most severe information problems, i.e. stocks with low analyst coverage, a high fraction of individual ownership, and high idiosyncratic volatility.

## 11. (Fang, Peress et al. 2014)'Does media coverage of stocks affect mutual funds' trading and performance?'

The study examining whether mutual funds' trading in the aggregate is influenced by media coverage of stocks. A comprehensive media coverage data was collected from Nexis Lexis for all NYSE stocks and 500 randomly selected NASDAQ stocks for the period 1/1/1993-12/31/2002. The data set include articles published about the sample stocks in four daily newspapers with nationwide circulation: USA Today, The Wall Street Journal, The New York Times, and The Washington Post, together, they account for $11 \%$ of the average weekday newspaper circulation in the United States. The main findings are as follows. First, in the aggregate, funds tend to buy more of those stocks that receive heavy media coverage. This result holds even after a control for size, liquidity, and several other stock characteristics that have been shown to influence funds' trades. The study found that funds' sells, in contrast, are not significantly affected by stocks' media coverage. Second, a negative relation between funds' propensity to buy stocks covered by the media and their performance in the cross-section.

## 12. (Ferguson, Philip et al. 2014)"Media content and stock returns: The predictive power of press.'

This study examines whether tone (positive and negative) and volume of firm-specific news media content provide valuable information about future stock returns, using UK news media data from 1981-2010. By studying both positive and
negative measures of media content, the study uses the overall distribution of news to gain insight into the information embedded in news articles. The study is conducted using a large news media dataset from the UK market. The sample consists of 264,647 firm-specific UK news media articles covering FTSE 100 firms over the period 1981 to 2010. The sources of news articles are national newspapers that are globally recognized, namely, The Financial Times (FT), The Times, The Guardian and Mirror. The words in each article are compared to Loughran and McDonald's (2011) positive and negative financial word lists to identify the number of positive and negative words in a financial context. Specifically, the study found that positive as well as negative words in news stories convey valuable information about future returns. Positive words in firm-specific news media content significantly predict higher returns in the next trading period, while negative words in firm-specific news media content significantly predict lower next trading period returns.

## 13. (Gadarowski 2002) "Financial press coverage and expected stock returns."

This study investigates whether the level of recent news coverage on a firm can predict differences in subsequent returns and whether this predictive power is more consistent with behavioral than rational asset pricing. While many studies investigate potential behavioral pricing using specific news events, this study examines whether the quantity of news can predict returns in a manner consistent with behavioral pricing biases. The sample in this study is based on NYSE stands for New York Stock Exchange (NYSE) and American Stock Exchange (AMEX) nonfinancial firms that have a history of returns for at least two years ending in June of each year. The main results of the study are as follow: First, a count of recent Dow Jones News Service stories, adjusted for equity capitalization, predicts differences in returns of about $4 \%$ per year for the average firm. Second, the predictive power of news counts is concentrated among firms with low book-to-market ratios, with the highest news-count firms among low book-to-market firms earning returns $10 \%$ below those with the lowest news counts. Third, adjusting for potential systematic risk related to the market, Fama-French factors, and factor mimicking portfolios based on news counts cannot explain the poor performance of low book-to-market firms with high news counts. Fourth, a non-systematic return effect potentially associated with market incompleteness with respect to information also cannot
explain the predictive power of news counts among low book-to-market firms. Fifth, this predictive power persists for up to two years beyond identification but diminishes in the third year. Lastly, the time-series of this concentrated news count effect is negatively related to lagged changes in macroeconomic conditions.

## 14. (Garcia 2014)'The kinds of financial journalism'

This study focuses on the content of financial news as a function of past market returns. As a proxy for media content, the authors used positive and negative word counts from general financial news columns from the Wall Street Journal and the New York Times. The study includes the content of over seventy thousand columns on financial affairs from the New York Times and the Wall Street Journal from 1905 to 2005. The study has established a strong non-linearity between lagged market returns and the content of financial news. The shape of the relationship is present in all subsamples that have studied, and holds not just for the last trading day, but also even for returns 2-4 days before publication. The evidence is conclusive: negative market returns taint the ink of typewriters, while positive returns barely do.

## 15. (Griffin, Hirschey et al. 2011)'How important is the financial media in global markets?'

The study investigates the differences in the information content of public news announcements in international equity markets. It quantified how the market react to these announcements varies across countries and examined potential explanations for these differences. The main data in this article consist of firm stock returns, news articles, earnings and takeover announcements, and country-level descriptive variables. The sample of general news articles from January 2003 to June 2009 covers 2,593 firms, with 572,987 news articles in 26 developed markets and 298,614 in 30 emerging markets. The study found that volatility on event days varies substantially both between developed and emerging markets and within each category. Stock price moves range from $50 \%$ more than normal volatility in a number of developed markets (Denmark, the United Kingdom, Sweden, the Netherlands, the United States, Finland, Hong Kong, and Germany) to less than 5\% more than normal in several emerging markets (Thailand, Turkey, Mexico, and Indonesia). Additionally, even among developed or emerging markets, there are large differences in the extent to which stock prices respond to news.

## 16. (Heston and Sinha 2014) 'News versus sentiment: Comparing textual processing approaches for predicting stock returns."

This study tests whether news can predict stock returns. The authors used the "bag of words" dictionary approach and compare it with a neural network approach on identical data. The empirical analysis uses 900,754 articles tagged with firm identifiers from the Thomson-Reuters news system over the calendar years 20032010. The authors match the sentiment data with the text data using the timestamp and story id for all the items in the sentiment data and obtain a dataset that contains the text as well as the probabilities of the article being positive, negative and neutral. The basic unit of analysis is a sentence. They measure the sentiment for a given firm as the average positive minus negative sentiment on all stories about that firm in a formation period. The study found that news tone indeed has an effect on stock returns. Positive news predicts positive returns for only about one week, but negative news predicts negative returns for up to a quarter.

## 17. (Kerl, Schürg et al. 2014)' The impact of financial times Deutschland news on stock prices -post announcement drifts and inattention of investors."

This study analyzes the impact of Financial Times Deutschland (FTD) news on stock prices and trading volumes. The study based on a sample of all news on German DAX, MDAX and SDAX companies published within the news section of the FTD between 2006 and 2010. The main two questions in the study are: first, to what extent news, which are published by the German major financial newspaper Financial Times Deutschland (FTD) impact stock prices? Second, what is the speed of price adjustment? The results show that articles that contain positive (negative) information are associated with significantly positive (negative) abnormal returns and abnormal trading volumes around their publication.

## 18. (Ozik and Sadka 2012) 'Media and investment management.'

The aim of this study is to find the relation between the media coverage of funds and their future performance. The authors focus on the media coverage of the investment management industry, specifically equity hedge funds. The study asked the following four questions: Do different media sources systematically differ in the manner in which they cover hedge funds? Are they overly negative or too lenient? Do media contain information about future fund performance? And, do investors understand this information and act upon it? The authors classify news items about
equity hedge funds over 1999 to 2008 into three source groups: General newspapers, specialized magazines, and Corporate Communication. The study found that Corporate-covered funds outperform and General-covered funds underperform, with a performance difference of about $11 \%$ annually.

## 19. (Peress 2011)'The impact of the media in financial markets: evidence from newspaper strikes."

This study investigates the causal impact of the media in financial markets by exploiting exogenous media blackouts resulting from national newspaper strikes in several countries. Over the period 1989-2010, the author found 52 eligible national newspaper strikes, lasting on average 1.7 business days and amounting to 88 strike days in total. They are concentrated in four countries: France, Greece, Italy and Norway. The author collected data on newspaper strikes that prevent readers from receiving news, either because newspapers are not written (a journalists' strike), not printed (a printers' strike) or not distributed (a distributors' strike). The study found only weak evidence of a matching reduction in stock return volatility. Together, these findings suggest that the media are not essential to the informational efficiency of stock prices, even though they play an important role in propagating information among investors.

## 20. (Schmitz 2007) "Market and individual investor's reactions to corporate news in the media."

The study aims at answering the question: how is precise and new information is reflected in prices of securities? Analysis is based on roughly 300,000 corporate news on 125 large and medium-sized companies in 5 large daily newspapers and 7 TV news shows from Germany between July 1998 and October 2006. The author analyzed every report in the leading nationwide daily newspapers and the main TV news and evaluate whether it is good, neutral or bad news for the respective company. For good news, he found an economically and statistically important reaction on the event day. The returns of the stocks are on average $1.12 \%$ higher than on other days. In addition, there exists a significant post event drift of $0.28 \%$ in the same direction as the initial reaction on the next day, indicating at an initial under reaction to the information. The results also indicate that individual investors do indeed react slightly slower to new information than the average investor, whereas warrant investors react faster than stock traders do.

## 21. (Sinha 2010) 'Underreaction to news in the US stock market."

The study aims at measuring the tone of news articles by constructing a weekly measure of qualitative information. The score is derived from the words and phrases. In contrast to previous research, the author used news articles from a wire service. The news data were obtained from the Thomson Reuters NewsScope dataset between 2003-2010, it consists of 9.4 million firm-specific news items. The study followed the text-processing engine method which analyzing an article at the sentence level rather than the word level. The main results of the study are: First, the market underreacts to the tone of news articles. The under reaction is not limited to small stocks, stocks with few analysts, and stocks with few institutional holdings. Second, the portfolio resulting from the long-short WQI-based trading strategy is highly correlated with the UMD factor. Third, the news provides a simple explanation for the short-term reversal of stock returns.

## 22. (Tetlock 2007) 'Giving content to investor sentiment: The role of media in the stock market."

The study attempts to characterize the relationship between the content of media reports and daily stock market activity, focusing on the immediate influence of the Wall Street Journal's (WSJ's) "Abreast of the Market" column on U.S. stock market returns. The collected data consists of time series of daily returns from January 1, 1984, to September 17, 1999, from the Wharton Research Data Services’ access to the historical Dow Jones Industrial Averages. The author used General Inquirer (GI), a well-known quantitative content analysis program, to analyze daily variation in the WSJ "Abreast of the Market" column over the 16 -year period. The study reached to three main results; First and foremost, it found that high levels of pessimistic media predict more pressure on market prices, followed by a reversion to fundamentals. Second, pessimistic media forecast unusual high or low values of market trading volume. Third, low market returns lead to more pessimistic media. These findings suggest that the measures of media content serve as a proxy for investor sentiment or non-informational trading.

## 23. (Tetlock, Saar-Tsechansky et al. 2008) 'More than words: Quantifying language to measure firms' fundamentals."

The study analyzes the impact of negative words in all Wall Street Journal (WSJ) and Dow Jones News Service (DJNS) stories about individual S\&P 500 firms from 1980 to 2004 in an effort to predict the earnings of firms accounting and stock returns. The three main sources are analysts' forecasts, quantifiable publicly
disclosed accounting variables, and linguistic descriptions of firms' current and future profit-generating activities. A news story was included in the analysis only if it occurs while the firm is a member of the S\&P index and is within 25-year period. The first result is that negative words convey negative information about firm earnings beyond stock analysts' forecasts and historical accounting data. The second result is that stock market prices respond to the information embedded in negative words with a small, one-day delay.

## 24. (Von Beschwitz, Keim et al. 2013) "Media-driven high frequency trading."

The study investigates whether coverage in RavenPack increases the speed at which the market reacts to news. The data used in this study was derived from three sources: Data on news releases came from RavenPack; intraday stock market data came from TAQ; and daily stock market data come from CRSP. RavenPack provides real-time news analytics based on the Dow Jones Newswire. This service analyzes all the articles on the Dow Jones Newswire with a computer algorithm and delivers article-level relevance and sentiment metrics to its users. The study found that the market's speed of reaction, defined both in terms of absolute stock returns and trading volume concentrated in the first 5 seconds compared to the total reaction over 120 seconds, is positively and significantly greater for relevant articles that were released as highly relevant (HRH) than for those that the old technology labeled as having no relevance or a low relevance (HRL).

## 25. (Wisniewski and Lambe 2013)" The role of media in the credit crunch: the case of the banking sector."

This study investigates the dynamic relationship between the intensity of negative media speculation and the market performance of financial institutions. The authors derive the measures of pessimistic media attention by focusing on all English language news contained in the LexisNexis database. More specifically, they recorded the number of articles mentioning negatively charged phrases over monthly intervals. The study covered three countries with established capital markets, where English is an official language (US, UK, Canada). The study used the value-weighted FTSE Banks indices downloaded from DataStream. The sample period extends from the end of January 2005 to the end of May 2010. Granger causality test results demonstrate that media reports can influence the future movements of stock prices,
while the evidence that journalists simply echo previous months' market developments is somewhat weaker. According to the simulations, an increase in negative coverage induces a statistically significant response in the future returns on banking stocks.

### 3.3 Annual reports and social media based studies

There is only one study in the literature used approach to quantify the tone of 10-K filings; an annual report required by the U.S. Securities and Exchange Commission (SEC), and four studies used financial media content.

## 1. (Bollen, Mao et al. 2011)"Twitter mood predicts the stock market."

This study investigates whether measurements of collective mood states derived from large-scale Twitter feeds are correlated to the value of the Dow Jones Industrial Average (DJIA) over time. To analyze the text content of daily Twitter feeds, the authors used two mood tracking tools, namely OpinionFinder that measures positive vs. negative mood and Google-Profile of Mood States (GPOMS) that measures mood in terms of 6 dimensions (Calm, Alert, Sure, Vital, Kind, and Happy). They obtained a collection of public tweets that was recorded from 28 February to 19 December 2008 ( $9,853,498$ tweets posted by approximately 2.7 million users). The results show that changes in the public mood state can indeed be tracked from the content of large-scale Twitter feeds by means of rather simple text processing techniques and that such changes respond to a variety of socio-cultural drivers in a highly differentiated manner. Among the 7 observed mood dimensions only some are Granger causative of the DJIA; changes of the public mood along these mood dimensions match shifts in the DJIA values that occur 3 to 4 days later.

## 2. (Chen, De et al. 2014) 'Wisdom of crowds: the value of stock opinions transmitted through social media."

This study investigates the extent to which investor opinions transmitted through social media predict future stock returns and earnings surprises. It conducts textual analysis of articles published on one of the most popular social-media platforms for investors in the United States. The authors consider the readers' perspective as inferred via commentaries written in response to these articles. They extract user-generated opinions from Seeking Alpha (SA) (http://seekingalpha.com).

From August 2013, SA had between 500,000 to 1 million unique visitors per day and, as such, was one of the biggest investment-related social-media websites in the United States. The study found that the opinions revealed on this site strongly predict future stock returns and earnings surprises. The predictability holds even after controlling for the effect of traditional advice sources, such as financial analysts and newspaper articles. Together, this findings point to the usefulness of peer-based advice in financial markets.

## 3. (Chung and Liu 2011) "Predicting stock market fluctuations from Twitter."

The study attempts to examine Twitter's predictive potential of consumer purchasing by observing the relationship between societal Twitter trends in the technology sector and hourly stock prices of the top gainers and top losers of ten companies in the technology sector for the period from November 29, 2011 to December 2, 2011. To quantify the data collected from Twitter.com, the authors carried out what is called sentiment analysis, a quantitative way of measuring positive or negative sentiment of the selected Twitter community of their interest. The study concludes that the twitter sentiment score may predict the movement of stocks if the sentiment score is trending positive, not negative. However, stock price movements are more strongly predictive of twitter sentiment movements. There is no significant predictive power of trending negative sentiment scores on stocks relating to the subject.

## 4. (Jegadeesh and Wu 2013) "Word power: A new approach for content analysis."

This study presents a new approach for content analysis to determine the impact of various words in conveying positive or negative tone. The authors obtained all $10-\mathrm{Ks}$ filed in the 1995 through 2008 sample period from SEC's EDGAR database using a customized web crawling algorithm. The final sample contains 40,789 filings and 8,633 unique firms. For most of tests, they used the negative and positive word lists constructed by Loughran and McDonald (2011) (LM). In some tests, they used the word list from Harvard-IV-4- Psychosociological Dictionary 5 that has been previously used by Tetlock (2007) and others. The study found that measure of tone is significantly related to filing date returns after controlling for additional factors such as earnings announcement date returns, accruals and
volatility. In addition, it found that the accuracy and completeness of the underlying lexicon is secondary to the term weighting scheme. In other words, with the term weighting method, useful information can be extracted even if the underlying word lists contain extraneous words or when they are incomplete.

## 5. (Sprenger and Welpe 2011) 'News or noise? The stock market reaction to different types of company-specific news events."

This study presents a novel approach to identify stock-related news events from an investor perspective as an alternative to traditional media sources. It investigates the market impact of different types of company-specific news events (e.g., news related to corporate governance, operations, or legal issues) on S\&P 500 stock prices in order to discern real news that moves the market from insignificant noise without market reaction. It uses computational linguistics methods to distinguish between good and bad news by controlling for the sentiment (i.e. the positive vs. negative tone) of different news stories. The study focuses on the S\&P 500 to adequately reflect a wide spectrum of US equities. Ranging from 845 to 7,729 daily postings, this represents an average of 3,548 tweets per trading day. The results show that the absolute value of cumulative returns prior to a news event are more pronounced for positive news than they are for negative news, suggesting more widespread information leakage before good news. The market reaction differs substantially across various types of news events.

### 3.4 Summary

The common objective of the studies is to convert the tone of textual form into numerical value. It's considered positive if there is good news, and negative one if there is bad news. The studies use different methods to do that. Some studies analyze the content of media at article level; for example Kerl, Schürg et al. (2014) every single article is read by two of the authors and classified as either positive or negative. Otherwise, they classify it as neutral. Some studies analyze the content of media at sentence level such as (Sinha 2010). The remaining studies use a word base analysis, the most famous approach in textual analysis. The approach depends on counting the occurrence of positive and negative word in the text, giving each word a specific weight according to its importance and frequency of occurrence, and
measuring the tone of the text using the weight of the words. The studies, which used the word level analysis, differ in the word lists used. There are two main word lists used in the literature, Harvard psychosocial dictionary, and Loughran and McDonald negative and positive word lists.

As the study mentioned earlier, more than $60 \%$ of the literature belongs to the USA financial market, and the remaining $40 \%$ distributed into other regions. To the best of researcher knowledge, there is no study related to Arabic or local financial markets. The studies bout Arabic or local financial markets did not take the public media effect into the accounts. So, the researcher sees that there is a literature gap in the researches which take the public media tone as a variable affects stock performance.

The researcher benefited from literature in his methodology by many points: first, he used the textual analysis that used by the most of the studies in the literature. Second, he used (Ammann, Frey et al. 2014) word lists with some modifications, in order to become suitable for the reality of the local market, to measure the tone of the content. Third, he used the scheme that used by (Jegadeesh and Wu 2013) to find the weight of each word and the score of each documents.

## Chapter 4

## Methodology and data collection

## Chapter 4

## Methodology and data collection

### 4.1 Introduction

This chapter defines the study variables and derive the relation by which the questions can be answered. It also defines how the researcher measured the value of each variable, and how he collected the data about it. Then it explains the research design, and in more details, the methodology of choosing the sample, time period, and the data collection and analyzing methods.

As introduced in chapter 1 , the study aims at measuring the effect of newspaper economic content on the stock return and trading volume. Therefore, the study has one independent variable; it is the media tone, which reflects the sentiment of the content in the newspaper economic pages. This variable affects two dependent variables, stock returns and trading volume. All variable in the study will be measured on a daily base, the closing price will be taken into account in calculating stock returns, and the total number of traded shared will be taken into account in calculating trading volume.

The two dependent variables are financial, and have a quantitative nature, while the independent variable is media, and has a qualitative nature, so the researcher used a three-step method to convert it into a quantitative form in order to apply the regression analysis with the two financial variables. He used the word list approach to measure the tone by which the texts were written. This process formed the biggest challenge in the research, because doing it pushed us to count the number of occurrence of all words in each day within the four years' period. This means that about 340 word (roots and derivatives) through 1,461 days, this mean $(340 * 1,461=$ 496,740 data cells).

To convert the media tone from qualitative to quantitative form, the researcher used a three stages process. The first stage is the sampling, which include choosing a sample of words that represent the text, and then counting the frequency of each word. The second stage is weighting the words, which the researcher chose in the sample, and the third stage is calculating the score of each document. In counting stage, the researcher used a software program called "General Architecture for Text Engineering GATE"

Then he developed a multiple linear regression samples for the two model: trading volume (TV) and returns (r). Each sample extends from the publishing day to the third day after publishing day.

The remaining part of the chapter describes in details the main sections of the economic pages in the three newspapers. There are common parts exist in two or three of them, such as trading bulletins.

Newspapers, which were taken into account in the study, are not specialized in the field of economics such as Financial Times and Wall Street. They mostly contain two pages of economic news. In some newspapers, these pages do not exist on the days that following the non-trading days, often (Saturday, and Sunday). Therefore, in order to get more accurate results, the study will analyze the content of the economic zones "only two pages", and they will be considered as a single document, and the content tone of the document will be measured, as the study will explain it later.

### 4.2Variables and research design

The daily stock return is considered in this study; it is based on the price change of a stock from the close of one trading day to the close of the next trading day. The daily stock return can be calculated as:

$$
\begin{equation*}
\mathbf{r}_{\mathbf{t}}=\frac{\mathbf{P}_{\mathbf{t}}-\mathbf{P}_{\mathrm{t}-\mathbf{1}}}{\mathbf{P}_{\mathbf{t}-1}} \tag{4.1}
\end{equation*}
$$

Where:
(rt): the stock return in day t
$(\mathbf{P t})$ : the stock price in the same day
( $\mathbf{P t}-\mathbf{1}$ ): the stock price in the previous day.
The closing price will be considered in all stock daily return calculations. Equation (4.1) can be written as:

$$
\begin{equation*}
r_{t}=\ln \frac{P_{t}}{P_{t-1}} \tag{4.2}
\end{equation*}
$$

Trading volume, which represents the total number of traded shares in a particular day, is an important measure of stock performance, Tetlock (2007) found
"that high media pessimism predicts downward pressure on market prices followed by a reversion to fundamentals, and unusually high or low pessimism predicts high market trading volume". These results are consistent with theoretical models of noise and liquidity traders. Engelberg and Parsons (2011) found that "local press coverage significantly affects the daily trading volume of local retail investors".

The researcher collected the data about stock trading volume for all listed companies (49 companies) by downloading them from the market website (www.pex.ps). The excel form that available from the market website contain three columns for trading volume for each stock, trading volume by number of traded shares, trading volume by dollars' amount, and the number of contract. The first column will be taken in account in analyzing the relation between media tone and trading volume.

### 4.3 Data collection

The data in the study is dividing into two sources: The first source is the historical data published by the PEX about stock price, trading volume and value, and number of contracts for each listed stock. The researcher downloaded these data about 49 listed companies from the market website (www.pex.ps) in excel format from 1 January 2011 to 31 December 2014. The companies vary in the number of trading days. Bank of Palestine has the most number of trading days during the period; its stocks have been traded in 982 days in four years, with average 245.5 day per year.

The second resource is the economic pages of three of the main local newspaper, Al-Hayaa, Al-Ayyam, and Felesteen. These newspapers contain many sections such as political news and articles, sports, health and beauty, and entertainment. Therefore, the study depended on analyzing the content of the financial or economic pages only.

The researcher collected the electronic copies for the three newspapers over the period from 1 January 2011 to 31 December 2014 as PDF format. Then he filtered the files to choose the economic pages. Some days, some newspapers do not contain any economic pages, especially on Saturday and Sunday, the two days that follow the non-trading days. The newspaper that has the most number of covered
days with economic pages is with total of 1,440 covered days, then Felesteen with total of 1,293 covered days, and finally Al-Hayaa with total of 1,029 covered days.

There are two period gaps in the time series of Felesteen newspaper, the first gap extended from 1 January to 28 February 2011. Although the newspaper was published in these two months, but the electronic copies are not available, and they are using the hard copies. To analyze the content is too difficult and take much time, therefore the researcher assumed the content as a missing data. The second gap extended from 9 July to 28 August 2014 and due to the Israeli war on Gaza, the newspaper stopped publishing in this period, and as the pervious case, the researcher assumed the content as a missing data.

### 4.4 Methodology and research design

The two sources of data mentioned in the previous paragraph are differ in their nature, while the stock data is fully quantitative; the media content is fully qualitative. The main challenge in this study is how to match between quantitative and qualitative data and find the market reaction to media tone? The solution lies in converting the newspaper content from qualitative form to quantitative form, by other word, quantifying the textual content. The researcher will quantify the language used in financial and economic news stories in an effort to predict stock prices returns. This approach has many names in the modern financial research, such as textual analysis, linguistic analysis, and data mining. Textual information processing has become a growing part of empirical finance research. Tetlock's pioneering studies Tetlock, Saar-Tsechansky et al. (2008) and Tetlock (2007) demonstrated that news stories contain information relevant to predicting both earnings and stock returns. Subsequent studies have applied similar techniques with a variety of news sources, dictionaries, and methodologies.

The tone in which news is written, is a critical factor in shaping public opinion, and thus, its effect on beliefs is an important subject to investigate. To measure the newspaper tone, the text content must be converted into numerical values represent the weight and direction of the tone, transforming the text form into numerical values looks like converting analog data to digital form. Converting analog data to digital form passing through three main stages: sampling, quantizing,
and encoding. Therefore, the text transforming process can be divided into three separated stages: sampling and word counting, word weighting, and scoring. Figure (4.1) show the sequence of these three stages.

Figure (4.1): stages of transforming text to numerical values process.

### 4.4.1 Sampling and word counting

Most existing literature on financial text mining relies on identifying a predefined set of keywords, this set is the sample of the total words the text consisted of; this method typically assigns weights to keywords in proportion to the movement of a share price. To implement this stage, the researcher followed these steps:

1. He constructed two word lists, each list contains fifty words. In word selection process, he depended on the word lists used by (Ammann, Frey et al. 2014) with some modifications in order to become suitable for the reality of the local market. For example, the researcher added "strategy" and "fund" to the positive list since the local economy depends strongly on the external funds and donation, which need efficient strategies to be rightly directed. In the same manner, he added " occupation", "closing", and "damages" to the negative list since they have a great impact on the local economy
the first list contains most common positive used words, and the second contains the most common negative used words, and for more accurate results, the researcher inserted most common derivatives for each root word, the total number of words in the two lists is 343 words, 50 roots and 138 derivatives in positive list, and 50 roots and 105 derivatives in negative list. Table (4.1) and (4.2) show the positive and negative lists of words and derivatives respectively.

Table (4.1): the positive list of words and derivatives

| \# | English | Arabic | derivatives |
| :---: | :---: | :---: | :---: |
| 1 | growth | نو | النمو، نما، ينمو، النامية، تتمية، التتمية، تتموية |
| 2 | organizing | تنظيم | ينظ، تنظّ، منظمة، نظام، النظام |
| 3 | support | دعم | الدعم، يدعم، مدعوم، الدععوم، داعم |
| 4 | increase | ازدياد | زيادة، الزيادة، يزيد، زاد، زادت |
| 5 | raise | رفع | ارتفاع، مرتفع |
| 6 | development | تطور | التطور ، تطوير، التطوير |
| 7 | building | بناء | البناء، تبني |
| 8 | cooperation | تعاون | التعاون، إعانة |
| 9 | opportunity | فرصة | الفرصة، فرص، الغرص |
| 10 | abundance | توفير | التوفير ، وفرة، متوفر |
| 11 | agreement | اتغاق | اتتق، توافق، اتفاقية، اتغاقيات |
| 12 | progress | تقدم | التقدم، متقدمة المتقدمة |
| 13 | best | أفضل | الأفضل |
| 14 | finance | تمويل | التمويل، تمول |
| 15 | quality | جودة | الجودة، جيد |
| 16 | protection | حماية | الحماية، يحمي |
| 17 | funds | منحة | المنحة، منح، المنح، ينح، تننح، المانحة |
| 18 | solutions | حول | الحول، حل، الحل |
| 19 | profit | ربح | يربح، أرباح، ربحية |
| 20 | income | دخل | الدخل |
| 21 | opening | ا | الافتتاح، افتّح، ينتح |
| 22 | continue | واصل | يواصل، مواصلة، تواصل، متواصل |
| 23 | able | قادر | يقدر ، قررة، مقدرة |
| 24 | Launch | إطلاق | أطلق، يطلق، انطلاق |
| 25 | force | قوة |  |
| 26 | employment | تشغيل | التشغيل |

| \# | English | Arabic | derivatives |
| :---: | :---: | :---: | :---: |
| 27 | construct | أنشأ | ينشئ، إنشاء |
| 28 | trust | تقة | اللتة، يثق، موثوق، واثق |
| 29 | stability | استقرار | الاستقرار ، استقر ، يستقر ، مستقر ، مستقرة |
| 30 | strategy | استراتيجية | الاستراتيجية، استراتيجي، الاستراتيجي |
| 31 | contributory | اسهام | يسهم، يساهم، مساهمة |
| 32 | rehabilitation | تأهيل | التأهيل، مؤهل |
| 33 | return | عائد | العائد، عوائد، عائدات، العائدات |
| 34 | allowance | السماح | سمح، يسمح، تسمح |
| 35 | encouragement | تشجيع | يشجع، تشجع |
| 36 | success | نجح | ينجح، ناجح، نجاح |
| 37 | efficiency | كفاءة | الكفاءة |
| 38 | easy | سهل | سهولة، تسهيل، تسهيلات |
| 39 | establish | أسس | يؤسس، تأسيس |
| 40 | clarity | وضوح | الوضوح، واضح، توضيح |
| 41 | safe | آمن | آمنة، أمان، الأمان |
| 42 | dividend | توزيعات | التوزيعات، وزعت، توزع |
| 43 | appropriate | مناسب | يناسب، مناسبة |
| 44 | positive | إيجابي | ايجابي، موجب |
| 45 | expansion | توسع | التوسع |
| 46 | transparency | الشفافية | شفافية |
| 47 | optimism | تغاؤل | التفاؤل |
| 48 | boom | ازدهار | الازدهار |
| 49 | innovation | ابتكار | الابتكار، مبتكر |
| 50 | satisfaction | رضا | الرضى |

Table (4.2): the negative list of words and derivatives ${ }^{i}$

| \# | English | Arabic | derivatives |
| :---: | :---: | :---: | :---: |
| 1 | less | أقل | الأقل، قليلة |

Note: In the previous two tables, the researcher inserted the Arabic and English meaning that is because the study is written by English language and the analyzed text is in Arabic. But in
the remain part of the study, all the positive and negative lists will be represented by the English meaning of the root word.
2. The researcher used a "General Architecture for Text Engineering" or "GATE" software for word counting. GATE is a Java suite of tools originally developed at the University of Sheffield beginning in 1995 and now used worldwide by a wide community of scientists, companies, teachers and students for many natural language processing tasks, including information extraction in many languages. It can be free downloaded from (https://gate.ac.uk/). The researcher used this software because it supports Arabic language and it's easy to use.

The researcher faced a big problem in word counting step with Gate software, this problem was in Al-Hayaa and Felesteen newspapers especially. The PDF files were saved by encoding the used software did not recognize. It was impossible to overcome this problem except by opening the files by the software and search for the word to be queried, and then copy and paste it into the search box in the software interface. These process takes a lot of time, especially when talking about two newspapers for four years, and 340 words, and in the case of daily analysis, the enquiries number is too large.

In order to accelerate the word counting process, the college provided us with a team of assistants consists of four students from the fourth level in Business Administration department, the researcher highlighted them by using the software and doing word enquiries, and then divided the period, each student takes one year.
the researcher collected the data about word counting which indices separately according to newspapers and years for each newspaper. Each word in the list has been counted in all years separately (from 2011 to 2014), then they have been counted in each day of 1,641 days in our period.

### 4.4.2 Word weighting

Many papers in this literature used a proportional weighting scheme, where the tone is measured by the ratio of negative or positive words to the total number of words in the document. This weighting scheme implicitly assumes that all words within a category are equally important.

Jegadeesh and Wu (2013) proposed a weighting scheme, where the weights for words are inversely proportional to the number of documents in the sample that the word found. This weighting scheme assumes that words that are found in fewer documents are more impactful than words that occur in more documents. Therefore, the researcher used (Jegadeesh and Wu 2013) scheme. The scheme is interpreted by determining the weight of all word in the list according to the number of occurrence by using the following relation:

$$
\begin{equation*}
W_{j}=\log \frac{N}{d_{f j}} \tag{4.3}
\end{equation*}
$$

## Where:

$\boldsymbol{W}_{\boldsymbol{j}}$ Is the weight of word j .
$\mathbf{N}$ is the total number of documents in the sample.
$\boldsymbol{d}_{\boldsymbol{j}}$ Is the number of documents where word j occurs at least once.
In the sample, the researcher assumed that all the economic pages were published in the same day as a one document. For example, on the first day of the series, 1 January 2011, the published economic pages were zero page in Al-Hayaa, one page in Al-Ayyam, and zero page in Felesteen. Similarly, on the last day of the series, 31 December 2014, the published economic pages were three pages in AlHayaa, four pages, and two pages in Felesteen. The document of the first day consists of one page only, while the last day consists of nine pages, and these nine pages will be assumed as one document in the analysis of its content.

According to the previous assumption, the time series consists of 1,461 documents, 365 documents at all of 2011, 2013, and 2014, and 366 documents at 2012. So the value of $(\mathrm{N})$ at equation (4.3) is equal to 1,461 . On some days, such as religious holidays, there were not any economic pages published on any one of the
three newspapers. These days were assumed as a dummy document to maintain the balance of the series, and the total number of dummy documents is 20 along the four years.

In order to calculate $\left(\boldsymbol{d} \boldsymbol{f}_{\boldsymbol{j}}\right)$ in equation (4.3), the number of documents where word j occurs at least once. In addition to the four students from the fourth level in Business Administration department, the researcher recruited three fresh graduated volunteers in collaboration with alumni affairs department at the university to distribute the HTML files generated by Gate software on the time series. This process is the most difficult step in the collection of data. In addition, it consumed much time and effort, it takes about 12 months.

### 4.4.3 Scoring

In the majority of days, there were pages from the three newspaper, in some days there were pages from one or two newspaper only, in a few days, there were no pages at all, these few days are feasts days.

To construct series of daily newspaper content tone, the researcher grouped all economic pages published in the same day and assumed them as a one document. All word counting was conducted depending on this base.

After calculating the two variable of equation (4.3)(N) and $\left(\boldsymbol{d} \boldsymbol{f}_{\boldsymbol{j}}\right)$ in the previous section, the weight of all word in the lists can be calculated directly by substituting in the equation. Now the score of document can be calculated by using the word weights as:

$$
\begin{equation*}
\operatorname{Score}_{\mathrm{i}}=\frac{1}{\left(1+\log \mathrm{a}_{\mathrm{i}}\right)} \sum_{\mathrm{j}=1}^{\mathrm{J}} \mathrm{w}_{\mathrm{i}, \mathrm{j}} \tag{4.4}
\end{equation*}
$$

## Where:

$\mathbf{a}_{\boldsymbol{i}}$ Is the total number of words in document i .
$\mathbf{j}$ is the total number of positive or negative words in the list.
The functional form for the score for document i can be written as:

$$
\begin{equation*}
\operatorname{Score}_{i}=\sum_{j=1}^{\mathrm{J}}\left(\mathrm{~W}_{\mathrm{j}} \mathrm{~F}_{\mathrm{i}, \mathrm{j}}\right) \frac{1}{\mathrm{a}_{\mathrm{i}}} \tag{4.5}
\end{equation*}
$$

## Where

$\mathbf{W}_{\mathbf{j}}$ Is the weight for word j
$\mathbf{F}_{\mathbf{i}, \mathrm{j}}$ Is the number of occurrences of word j in document i .
The term $\frac{1}{a_{i}}$ reflects the fact that the score is negatively related to the total number of words in the document.

To calculate the total number of words in each document $\left(a_{i}\right)$, the researcher converted all documents from PDF format into DOC format, and he used the property that Microsoft office word program provides to count the number of words in any document. He converted the PDF files directly through a specialist website http://pdf2doc.com/, which provides a free converting service to many document formats such as (DOCX, Text, JPG, and PDF).

It should be noted here that the converting process includes the text only and does not include images. This means that, if the image contains some words, they are not taken into account in calculating the total number of word in the documents $\left(a_{i}\right)$, whether those words were positive or negative. So ignoring them will not affect the media tone of the economic pages' content.

By the same manner, the images included words were neglected in positive and negative words counting by using Gate software ${ }^{(1)}$

1 -To facilitate the data analysis process, the researcher multiplied the score of all days by a constant factor $(10,000)$ to make the independent variable ( Mt ) values more usable, because the results of equation (4.5) will be a low value.

### 4.6 Trading volume predictability of news media content

As the study mentioned earlier, trading volume (TV) is measured by the total number of traded shares. The relation between the media content (media tone) and the stock return can be measured as follow:

1. Computing the correlation coefficients between the media tone (MT) and the trading volume:

$$
\rho(\mathrm{MT}, \mathrm{TV})
$$

Equation (4.6)
2. Using the following regression equation:

$$
\mathbf{T V}=\alpha+\beta \mathbf{M T}+\mathbf{C}
$$

Equation (4.7)

## Where:

TV Denotes the trading volume represented by traded shares.
$\boldsymbol{\alpha} \quad$ the intercept of the regression.
$\boldsymbol{\beta} \quad$ the regression coefficient of the media tone (MT).
C Denotes the zero-mean normally distributed residual.

Using the 3 days' lag rule for trading volume, equation (4.7) can be written as follow:

$$
\mathbf{T V}_{\mathbf{t}}=\alpha+\beta_{0} \mathbf{M T}_{\mathbf{t}}+\beta_{1} \mathbf{M T}_{\mathbf{t}-1}+\beta_{2} \mathbf{M T}_{\mathbf{t}-\mathbf{2}}+\beta_{3} \mathbf{M T}_{\mathbf{t}-\mathbf{3}}+\mathbf{C}
$$

## Where:

$\mathbf{T V}_{\mathbf{t}}$ Denotes the stock trading volume at the publishing day.
$\boldsymbol{\alpha} \quad$ The intercept of the regression.
$\mathbf{M T}_{\mathbf{t}} \quad$ The media tone at the publishing day.
$\mathbf{M T}_{\mathbf{t}-\mathbf{1}}$ The media tone at the next day of publishing.
$\mathbf{M T}_{\mathbf{t}-\mathbf{2}}$ The media tone after 2 days of publishing.
$\mathbf{M T}_{\mathbf{t}-\mathbf{3}}$ The media tone after 3 days of publishing.
C Denotes the zero-mean normally distributed residual.

### 4.5 Return predictability of news media content

The basic factor in studying the relations between newspaper articles and stock market behavior is stock return. After quantifying the tone of newspaper content, the second and the third hypotheses can be tested by a correlation and regression tests between media tone represented by $\operatorname{Scor}_{i}$ and the daily return separately to every listed company. Stock return can be predicted through two methods:

1. Computing the correlation coefficients between the media tone (MT) and the variation in the stock daily return (r):

$$
\begin{equation*}
\boldsymbol{\rho}(\mathbf{M T}, \mathbf{r}) \tag{4.9}
\end{equation*}
$$

2. Using the following regression equation:

$$
\begin{equation*}
\mathbf{r}=\boldsymbol{\alpha}+\boldsymbol{\beta} \mathbf{M T}+\mathbf{C} \tag{4.10}
\end{equation*}
$$

## Where:

$\mathbf{r}$ Denotes the stock return.
$\boldsymbol{\alpha}$ The intercept of the regression.
$\boldsymbol{\beta}$ The regression coefficient of the media tone (MT).
C Denotes the zero-mean normally distributed residual.

Because the effect of media tone extends for more than one day, and the investors may take a time to react to the tone, many previous studies investigate the relation between media tone and stock anomalies in the publishing day and other lags days. For example, Tetlock (2007) used 5 days lags for return, and Peress (2011) used 2 days lag for turnover. So the study will use 3 days' lag for the two dependent variables (return and trading volume). Thus, equation (4.10) can be written as follow:
$\mathbf{r}_{\mathbf{t}}=\alpha+\beta_{\mathbf{0}} \mathbf{M T}_{\mathbf{t}}+\beta_{\mathbf{1}} \mathbf{M T}_{\mathbf{t}-\mathbf{1}}+\beta_{\mathbf{2}} \mathbf{M T}_{\mathrm{t}-\mathbf{2}}+\beta_{\mathbf{3}} \mathbf{M T}_{\mathrm{t}-\mathbf{3}}+\mathbf{C}$

## Where:

$\mathbf{r}_{\mathbf{t}}$ Denotes the stock return at the publishing day.
$\boldsymbol{\alpha} \quad$ The intercept of the regression.
$\mathbf{M T}_{\mathbf{t}} \quad$ The media tone at the publishing day.
$\mathbf{M T}_{\mathbf{t}-\mathbf{1}}$ The media tone at the next day of publishing.
$\mathbf{M T}_{\mathbf{t}-2}$ The media tone after 2 days of publishing.
$\mathbf{M T}_{\mathbf{t}-\mathbf{3}}$ The media tone after 3 days of publishing.
C Denotes the zero-mean normally distributed residual.

## Chapter 5

Data analysis and results

## Chapter 5

## Data analysis and results

### 5.1 Introduction

This chapter explains the descriptive and empirical analysis and results. In all of them, the researcher used " R " language. R is a programming language and software environment for statistical computing and graphics supported by the R Foundation for Statistical Computing. The R language is widely used among statisticians and data miners for developing statistical software and data analysis. Polls, surveys of data miners, and studies of scholarly literature databases show that R's popularity has increased substantially in recent years.

The total number of economic pages is 8,666 pages. Al-Ayyam newspaper is the first with total of 3,386 pages, and average of 2.35 pages per day. Then Al-Hayaa with 2,857 pages and average of 2.78 pages per day. Finally, Felesteen with 2,423 pages and average of 1.87 pages per day. Table (5.1) explains the detailed statistics for the three newspapers segmented into four separately years and then show the average over the total period.

The descriptive analysis begins with positive and negative word frequencies, the results show the frequency for each word (the root and its derivatives), in each year and each newspaper separately and then as a total. The researcher used tables and clockwise charts to display the result. Clockwise chart is a way of summarizing a set of categorical data or displaying the different values of a given variable, and to the best of our knowledge, ours is the first locally study to use it. In addition, the researcher presents the percent and daily rate for all the words in each newspaper and in each year through the period from 2011 to 2014. The percent denotes the proportion of a word occurrence compared to the occurrence of all words, the summation of all percent is equal $100 \%$. Daily rate denotes the average daily occurrence for each word. Finally, he presents monthly rate, daily maximum, and monthly maximum and monthly minimum results for all words as a whole, separated into positive list and negative list. In addition, the researcher counted the number of occurrence for each listed company and each economic sector in each of the three newspaper, and in each year. The researcher has been keen to mention some comments to explain the anomalous values in those results.

Then he applied equation (4.3) to find the weight of each word, here he restricted himself to the roots only, by including each derivatives frequency in its root.

After calculating the weight of each word in the list, the researcher applied equation (4.5) to find the tone of each day, which equal to the summation of the weights of all words which occurred in that day, taking into account the sign of summation, positive for positive words, and negative for negative words. Then he found the number of positive, negative, and natural days in each newspaper and each year within the period 2011 to 2014.

Then he described independent and dependent variables by calculating the number of observation, mean, standard deviation, median, min and max score of media tone through the period of the study.

In the empirical analysis, the study applied a correlation test between media tone (MT) and trading volume (TV), and between media tone (MT) and return (r). The researcher explained the significant values, which statistically indicate that a relationship between the two variables is exist.

Then he applied multiple linear regression analysis for the two models, trading volume (TV) and return (r). The F-Test calculated to examine the appropriateness of the model as a whole, the R Square analysis, the Multicollinearity test and autocorrelation test. he also presented the results of the best regression model with independent variables that determined using stepwise method.

Table (5.1): statistics for the three newspapers economic pages and covered

| newspaper | year | number of <br> economic <br> pages | number of <br> covered <br> days | average <br> number of <br> pages per day | percentage <br> of covered <br> days |

### 5.2 Descriptive results

### 5.2.1 Positive and negative word frequencies

Table (5.2) shows the frequency, percent and daily rate for each positive word in Palestinian economic media (Al-Hayaa, Al-Ayyam and Felesteen) through the period of study (2011-2014), whereas the positive words that have the highest frequency were Growth, Organizing, Support, Raise and Increase with daily rate 5.0, 3.97, 3.51, 3.32 and 3.21 respectively. The positive words, which have the lowest frequency, were Transparency, Optimism, Innovation, Satisfaction and Boom with daily rate $\mathbf{0 . 1 2}, \mathbf{0 . 1 0}, \mathbf{0 . 0 9}, \mathbf{0 . 0 8}$ and $\mathbf{0 . 0 7}$ respectively. In general, the table shows that there are $\mathbf{2 5 2}, \mathbf{1 1 2}$ positive words in media content through the period of study with daily rate of 58 positive words per day. In addition, the following clockwise chart represents the daily rate for each positive word.

The following clockwise chart explains the frequency of the positive words on an index divided from 0 to 9,0 is the lowest frequency and 9 is the highest. The circular curve donates the value of frequency for each corresponding word. In this chart and all following similar charts, the red line represents Al-Hayaa values, black line represents Al-Ayyam values. And green line represents Felesteen values.

Figure (5.4): Daily Rate of Positive Words in Palestinian economic media (AlHayaa, Al-Ayyam, and Felesteen newspaper) through period 2011 to 2014.

Table (5.2): Frequency, Percent and Daily Rate for positive words in each newspaper through period 2011 to 2014.

Table (5.3) shows the frequency, percent and daily rate for each negative word in Palestinian economic media (Al-Hayaa, Al-Ayyam and Felesteen newspapers) through the period of study (2011-2014), whereas the negative words
that have the highest frequency were Decline, occupation, Retreat, Crisis and Needs with daily rate of $\mathbf{3 . 7 0}, \mathbf{2} . \mathbf{3 0}, \mathbf{2} .14, \mathbf{2} .13$ and $\mathbf{2 . 0 1}$ respectively. The negative words, which have the lowest frequency, were Restructuring, Defect, Failure, Bankruptcy and Critical with daily rate $\mathbf{0 . 0 9}, \mathbf{0 . 0 8}, \mathbf{0 . 0 8}, \mathbf{0 . 0 5}$ and $\mathbf{0 . 0 4}$ respectively. In general, the table shows that there are $\mathbf{1 5 9 , 5 9 0}$ negative words in media content through the period of study with daily rate of 36 negative words per day. In addition, the following clockwise chart represents the daily rate for each negative word.

Figure (5.5): Daily Rate of Negative Words in Palestinian economic media (AIHayaa, Al-Ayyam, and Felesteen newspaper) through period 2011 to 2014.

Table (5.3): Frequency, Percent and Daily Rate for negative words in each newspaper through period 2011 to 2014.

The main reason of raising the word "building" to the top five in 2014 was the
Israeli war on the Gaza Strip in that year, which caused, according to the
governmental statistics, total and partial damage for nearly 20,000 housing units. This was followed by a daily news in the local newspapers about building and reconstructing.

Table (5.5) shows the frequency, percent and daily rate for negative words in Palestinian economic media (Al-Hayaa, Al-Ayyam, and Felesteen newspapers) in each year 2011, 2012, 2013 and 2014. Whereas the five negative words that have the highest frequency were Decline, occupation, Retreat, Crisis and Needs in 2011 and 2014, but in 2012 there were Decline, occupation, Tax, Crisis and Needs, and in 2013 there were Decline, occupation, Retreat, Tax and Needs. The five negative words that have the lowest frequency in 2011 were Monopoly, Defect, Failure, Bankruptcy and Critical, in 2012 there were Monopoly, Conflict, Failure, Bankruptcy and Critical, in 2013 there were Restructuring, Defect, Failure, Bankruptcy and Critical and in 2014 were Restructuring, Defect, Monopoly, Bankruptcy and Critical.

In general, the researcher notes that the daily rate of negative words in 2011 is 39 words per day, in 2012 there are 36 words per day, in 2013 there are 34 words per day and in 2014 there are 36 words per day; the following clockwise chart represents the daily rate for each negative word according to each year.

Figure (5.7): Daily Rate of Negative Words in Palestinian economic media (AIHayaa, Al-Ayyam, and Felesteen newspaper) for each year.

Table (5.5): Frequency, Percent and Daily Rate for negative words in newspapers for each year.

| Negative Words | 2011 |  |  | 2012 |  |  | 2013 |  |  | 2014 |  |  |

The following two figures (5.8 and 5.9) represent the frequency of positive and negative words separately in a word cloud chart form. Figure (5) shows the positive words and figure (6) shows the negative words.

Table (5.6) shows the summary of frequently economic positive and negative words in Palestinian economic media content through the period of study 2011 2014, whereas the table presents annual frequency, annual percent, daily and monthly rate, daily and monthly maximum and monthly minimum in each year for each newspaper.

Figure (5.8): Word cloud chart for Positive Words in Palestinian economic media (Al-Hayaa, Al-Ayyam, and Felesteen newspaper) through period of study.

Figure (5.9): Word cloud chart for Negative Words in Palestinian economic media (Al-Hayaa, Al-Ayyam, and Felesteen newspaper) through period of study.

Table (5.6): Frequency, Percent, Daily Rate, Monthly Rate, Daily Maximum, Monthly Maximum and Monthly Minimum of Positive and Negative words in Palestinian Media for 2011 - 2014.

Table (5.6) consists of four horizontal and two vertical panels; the first vertical panel contains statistical data about positive word and the second panel contains statistical data about negative words, such data includes (Freq.: the number of occurrence for all positive words in each year and in a total. Percent: the year's proportion of positive words from the overall counting. Daily and Monthly Rate: positive word occurrence rate for each year and in total. Daily and Monthly Max: the maximum number of occurrence for each year and in total. Monthly Min: the minimum number of occurrence in each year and in total.

The first horizontal panel contains the statistical data about Al-Hayaa newspaper, the second is about Al-Ayyam, the third is about Felesteen, and the last panel is about all the three newspapers.

Figure (5.10): Daily and monthly rate, Annual and Monthly frequency for positive and negative words in Palestinian economic media through 2011 - 2014.

Figure (5.10) is segmented into four sections as, the upper and down left sections include the daily and monthly rate of positive and negative words occurrence in each year (2011-2014) respectively, they show that there are no big differences between the daily rate over the four years, the positive words rate lies between 55 and 59, and the negative words rate lies between 34 and 39 , and the same case is in the monthly rates, they are almost equally over the years. The upper and downright sections include the annual and monthly rate of positive and negative words occurrence in each year (2011-2014) respectively.

| Monthly Frequency Of Positive \& Negative Words | Monthly Frequency Of Positive \& Negative Words |
| :---: | :---: |
| Monthly Frequency Of Positive \& Negative Words | Monthly Frequency Of Positive \& Negative Words |

Figure (5.11): Monthly frequency of positive and negative words in Palestinian media for each year 2011, 2012, 2013 and 2014.

The four curves in figure (5.11) represent the monthly rate of occurrence of the positive and negative words for each year separately. From the curves, the researcher can trace the following notes:

1. During February 2011, the curve of both positive and negative words have significantly declined, this declining may be due to the political disturbance in Egypt, which guided the local newspapers to focus on the political news over the economic news. From March to July 2011, the positive and negative curves continue raising regularly.
2. During August 2011, the negative word curve raised and became close to the positive curve. This converge happened also during August 2014.
3. The negative curve during 2013 has not changed significantly throughout the year, and it was almost flat.
4. During July 2014, the two curves have significantly declined. The positive curve declined steeper than negative curve, this is due to the Israeli war on Gaza form 7 July to 26 August 2014.

Figure (5.12): Daily Rate of positive and negative words in Palestinian economic media for each year 2011, 2012, 2013, 2014, and overall.

Figure (5.12) shows the daily rate of occurrence for positive and negative words in each year, and in the total of period (2011-2014). From the figure, the researcher notes the following:

1. In Al-Hayaa and newspapers, the positive words rate is higher than the negative words rate during the overall period and during each year separately.
2. In Felesteen newspaper, the difference between the two rates is small during the overall period (29:24), and during each year separately, comparing with AlHayaa and Al-Ayyam newspapers. They have the same value in 2011 ( 25 word in each day). 2013 can be excluded from this note, because the difference can be considered meaningful (39:25).
3. Except 2011, Al-Ayyam newspaper has the highest rate of occurrence for positive and negative words, and in contrast, Felesteen newspaper has the lowest rate.

### 5.2.2 The weight of words

After finding the number of occurrence for each word in the list in each day during the period (2011-2014), the researcher calculated $\left(\boldsymbol{d} \boldsymbol{f}_{\boldsymbol{j}}\right)$, the number of documents where word j occurs at least once. Then he applied equation (4.3) to find the weight of each word. Table (5.7) show the results of weighting the words. the researcher should remember here that the value of $(\mathrm{N})$ in equation (4.3) is 1,461 , the total number of documents in the sample (2011-2014).

From table (5.7) the researcher found that the low frequency words have high weight, and vice versa. In general, the negative words have a higher weight than positive words. The word (bankruptcy) has the highest weight in the two list, and the word (growth) has the lowest weight.

### 5.2.3 Positive and negative days

After calculating the weight of each word in the list, and finding the words occurred in a given day and their frequencies, the researcher calculated the score of each day by equation (4.5). And because the study counts the frequency of each newspaper and for each year separately, the researcher can find the number of positive and negative days for each year and for each newspaper to visualize the tone of them. In order to do that, he consider the days that have media tone (MT) lies between $( \pm 0.00005)$ as a natural day. The days with no newspaper publishing are
also considered natural days. Table (5.8) show the number of positive days, negative days, and natural days respectively on the year base. Table (5.9) show the number of positive days, negative days, and natural days respectively on the newspaper base

Table (5.7): the weight of positive and negative words

| $\#$ | Positive words |  |  |  |  |  |  | Negative words |  |  |

Figure (5.13): the weight of positive words.
the weight of the word inversely related to the frequency, this mean that when the readers became familiar with high frequently words, the effect of them will decline, and vice versa.

Figure (5.14): the weight of negative words.

Table (5.8): the number of positive days, negative days, and natural days in each year from 2011-2014.

| year | Number of <br> positive days | Number of <br> negative days | Number of <br> natural days | Total number <br> of days |
| :---: | :---: | :---: | :---: | :---: |
| 2011 | 122 | 217 | 26 | 365 |
| 2012 | 157 | 178 | 31 | 366 |
| 2013 | 153 | 179 | 33 | 365 |
| 2014 | 125 | 212 | 28 | 365 |
| total | $\mathbf{5 5 7}$ | $\mathbf{7 8 6}$ | $\mathbf{1 1 8}$ | $\mathbf{1 , 4 6 1}$ |

Figure (5.15): the number of positive days, negative days, and natural days in each year from 2011-2014
the researcher notes here that the number of natural days in Al-Hayaa newspaper is large in comparing with other two newspapers; this is because of the number of publishing days. While Al-Ayyam and Felesteen newspapers published economic pages every day, Al-Hayaa newspaper did not publish on Saturdays and Sundays, and these days are a natural day.

Table (5.9): the number of positive days, negative days, and natural days in each newspaper (Al-Hayaa, Al-Ayyam, and Felesteen) from 2011-2014.

| Newspaper | Number of <br> positive days | Number of <br> negative days | Number of <br> natural days | Total number <br> of days |
| :---: | :---: | :---: | :---: | :---: |
| Al-Hayaa | 755 | 181 | 525 | 1,461 |
| Al-Ayaam | 725 | 419 | 317 | 1,461 |
| Felesteen | 678 | 458 | 325 | 1,461 |
| total | $\mathbf{2 , 1 5 8}$ | $\mathbf{1 , 0 5 8}$ | $\mathbf{1 , 1 6 7}$ |  |

Figure (5.16): the number of positive days, negative days, and natural days in each newspaper (Al-Hayaa, Al-Ayyam, and Felesteen) from 2011-2014.

### 5.2.4 Companies and sectors frequencies

As well as the words, the researcher counted the number of occurrence for each listed company in each of the three newspaper, and in each year separately. In addition, by the same manner, he counted the number of occurrence for each economic sector such as Banking and Financial Services, Investment, Insurance, Services, and Industry.
Table (5.10): details of trading days for all listed companies from 2011 to 2014

Note: Beit Jala Pharmaceutical BJP was listed in PEX in 03/05/2015, to became 50 firms in 31/12/2015

Figure (5.17): trading day for the top five companies
Table (5.11) shows the numbers of occurrence for the five economic sectors in Palestinian media according to newspaper through period 2011 - 2014, whereas the total number of occurrence for Banking and Financial Services sector is 7,899, the total number of occurrence for Investment sector is 8,940 , the total number of occurrence for Insurance sector is 6,982 , the total number of occurrence for Industry sector is 4,187 , and the total number of occurrence for Industry sector is 3,976 . Figure (5.18) shows the time movement of economic sectors annual number of occurrence through 2011-2014

Table (5.12) shows the total number of occurrence of Companies names in the Palestinian media through period 2011 to 2014, whereas the total was calculated twice, the first based on the newspaper and the second based on years. According to general total, the researcher notes that BOP, QUDS, PALTEL, NIC and TNB are the five companies that have the highest occurrence in media respectively. JREI, ELECTRODE, PID, PALAQAR and PHARMACARE are the five companies that have the lowest occurrence in media respectively. BJP has no occurrence in media through the period of the study because it was listed in PEX in 03/05/2015.

Table (5.11): Number of occurrence of economic sectors in Palestinian economic media (Al-Hayaa, Al-Ayyam, and Felesteen newspapers) through period 2011 to 2014.

Figure (5.19): Average of number of occurrence Companies names in the Palestinian media (Al-Hayaa, Al-Ayaam and Felesteen newspapers) through period 2011 to 2014.

### 5.3 Description of independent and dependent variables

Table (5.13) shows the descriptive statistics of independent variable (tone score of media content MT) through the period of the study in each year, whereas the mean of tone score was negative in 2011, 2012 and 2014 but it was positive in 2013. The minimum tone score was negative in all years but maximum tone score was positive in all years. Figures (5.20, 5.21, 5.22, and 5.23) show the time movement of tone score during joint days in each year. Only the tones of the trading days are taken in account here.

In addition, table (5.13) shows the number of trading days, mean and standard deviation of dependent variables (Returns r, Trading Volume TV) and independent variable (Media tone MT) for each company in Palestine market through its trading days.
Table (5.13): Number of observation, Mean, standard deviation, Median, Min and max of score of media tone through 2011-2014.

| Years | $\mathbf{N}$ | Mean | St.dev | Median | Min | Max |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2011 | 248 | -1.383 | 5.925 | -0.869 | -49.714 | 11.433 |
| 2012 | 249 | -0.138 | 5.315 | 0.600 | -30.292 | 13.674 |
| 2013 | 241 | 0.418 | 4.675 | 0.734 | -14.476 | 14.399 |
| 2014 | 245 | -0.472 | 5.215 | -0.472 | -14.006 | 24.230 |
| Total | 983 | -0.399 | 5.338 | 0.085 | -49.714 | 24.230 |

From table (5.13) the researcher traces the following notes:

1. 2012 has the highest number of joint days (the days that have media publishing and stock market exchanging), where 2013 has the lowest number.
2. 2013 is the only year in the period, which has a positive mean of media tone, while the other three years have a negative mean, the main reason, from my perspective, is the surrounding political climate. 2012 and 2014 witnessed two Israeli wars on Gaza Strip; these wars have led to the destruction of a large number of houses, public facilities, economic and trade facilities. 2011 witnessed a political unrest and regime change in Egypt.
3. In the joint days, the most positively day is 9 July 2014 with a media tone value of (24.230), while the most negative day is 3 January 2011, with a media tone value of (-49.714).
(20.0000

N : Number of trading days.

Figure (5.24): Mean of media tone for all listed companies at joint days through period 2011 to 2014.

The three figures (5.24), (5.25), and (5.26) are clockwise charts, which represent respectively the mean of the three variables; media tone (MT), return (r), and trading volume (TV).

Figure (5.25): Mean of return for all listed companies at joint days through period 2011 to 2014.

Figure (5.26): Mean of trading volume for all listed companies at joint days through the period from 2011 to 2014.

### 5.4 Empirical analysis and results

In the previous section, I explained the descriptive result about the media content analysis, and traced the main properties of the media tone during the period 2011-2014. This section represents the empirical analysis of the relationship between the media tone (MT) and the stock anomalies (return r , and trading volume TV). The researcher will begin with the correlation analysis to investigate the existence of the
relations, and then apply the regression analysis to investigate the shape of the relations.

### 5.4.1 Correlation analysis

Table (5.15) shows the correlation coefficient between media tone and each of trading volume and return variables for each listed company in Palestinian Market. Based on the results in table below, the researcher notes that there is no statistically significance relationship at 0.05 level between the score of media and trading volume in each company except WATANIYA ( $\mathrm{r}=-0.081$, sig $=0.012$ ), GCOM $(0.101$, $\mathrm{sig}=$ 0.004), LADAEN ( $\mathrm{r}=-0.171, \mathrm{sig}=0.007$ ) and PICO ( $\mathrm{r}=0.499, \mathrm{sig}=0.042$ ). There is no statistically significance relationship at 0.05 level between the media and return in each company except $\boldsymbol{T} \boldsymbol{N B}(\mathrm{r}=-0.078$, sig $=0.021)$, $\boldsymbol{A I B}$ ( 0.075 , sig = 0.047),

AQARIYA ( $\mathrm{r}=-0.115$, sig = 0.042) and ELECTRODE ( $\mathrm{r}=-0.260$, $\mathrm{sig}=0.030$ ).
Table (5.15): the correlation coefficient between media tone and each of trading volume and return variables for each listed company in Palestinian Market.

Hints: Bold font Mean the correlation is significant at 0.05 level.

### 5.4.2 Multiple linear regression analysis for model I (trading volume)

This part aimed at establishing the effect of the Palestinian media tone (MT) on the Trading Volume (TV) for each company in Palestinian market (see Appendix 5 in full details), whereas (MT) variable inserted to the model in level, first lag, second lag and third lag. The F-Test calculated to examine the appropriateness of the model as a whole, the R Square analysis, the Multicollinearity test and autocorrelation test.

Table (5.16) shows the results of regression of TV on MT, MT(-1), MT(-2) and MT(-3), whereas the Bo is the regression coefficient of MT. B1 is the regression coefficient of MT(-1). B2 is the regression coefficient of MT(-2) and B4 is the regression coefficient of MT(-3). Table 11 presents the results of multiple linear regression with all independent variables (MT in level and lags). Table (5.17) presents the results of the best regression model with independent variables that determined using stepwise method.

Table (5.16): Results of Regression Trading volume on media tone score in level, first lag, second and third lag of media tone score.

Note: the table contain 47 companies; the other two company have no trading days during the period.

Table (5.17) shows the results of the best regression model based on stepwise method, whereas the number of companies that have significance effect on media tone was 15 companies, for example the first lag of media tone has positive significance effect on trading volume of BOP with (0.09). It means that the media tone of today effects on BOP's trading volume. The second lag of media tone has positive significance effect on trading volume of NIC with (0.115) and the third lag has negative effect on trading volume of NIC with ( -0.103 ). It means that the media tone of today effects positively on NIS's trading volume on following days and it affects negatively after that.

### 5.4.3 Goodness- of -Fit Tests for Model I (trading volume)

According to the analysis of variance (ANOVA), the calculated values of F test (in table 12) at the 0.05 level was significant. Table 12 shows the regression which is significant as a whole; this means that media tone (MT) effects on trading volume (TV) of the companies in the table. Therefore, the F value proves that there is a significant relationship between the media tone and trading volume. $\mathbf{R}^{2}$ represents the prediction level of variance in trading volume (TV) by media tone (MT), whereas the lowest R-square is $0.60 \%$ for PEC Company as shown in table 12 above. This means that $0.6 \%$ of TV can be predicted from the first lag of MT.

Durbin-Watson (DW) statistics is the ratio of sum of squares of successive differences of residuals to the sum of squares of errors. As a rule of thumb, if the DW statistic is close to 2 , there is evidence of no serial correlation. All of Durbin-Watson statistic were close from 2; it means that there were no high serial correlation residuals of models except WASSEL and AHC. By analyzing variance inflation factor in model I, it can be said that all independent variables had VIF value less than 2.This finding suggests that multicollinearity was not a problem when selected explanatory variables.

Table (5.17): Results of Regression Trading volume on media tone score in level, first lag, second and third lag of media tone score, using stepwise method.

### 5.4.4 Regression Results for Model II

This part aimed at establishing the effect of the Palestinian media tone (MT) on the Return (R) for each company in Palestinian market (see Appendix 5 in full details), whereas (MT) variable inserted to the model in level, first lag, second lag and third lag. The F-Test calculated to examine the appropriateness of the model as a whole, the R Square analysis, the Multicollinearity test and autocorrelation test.

Table (5.18) shows the results of regression of R on MT, MT(-1), MT(-2) and MT(-3), whereas the Bo is the regression coefficient of MT. B1 is the regression coefficient of MT(-1). B2 is the regression coefficient of MT(-2) and B4 is the regression coefficient of MT(-3). Table (5.18) presents the results of multiple linear regression with all independent variables (MT in level and lags). Table (5.19) presents the results of the best regression model with independent variables that determined using stepwise method.

Table (5.18): Results of Regression Return on media tone score in level, first lag, second and third lag of media tone score.

| Companies | $\mathbf{N}$ | Regression Coefficients |  |  |  | Model fit |  |  |

Hints: Bold font Mean the coefficient is significant at 0.05 level.
The following table shows the results of the best regression model based on stepwise method, whereas the number of companied that have significance effect on media tone was 10 companies, for example the first lag of media tone has negative significance effect on return of BOP with (-0.065). It means the media tone of present days' effects on BOP's return of the following days.

Table (5.19): Results of Regression Return on media tone score in level, first lag, second and third lag of media tone score, using stepwise method.

| Companies | N | Regression Coefficients |  |  |  | Model fit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 5.4.5 Goodness- of -Fit Tests for Model I (return)

According to the analysis of variance (ANOVA), the calculated values of $F$ test (in table 14) at the 0.05 level was significant. Table (5.19) shows the regression which is significant as a whole; this means that media tone (MT) effects on Return $(\mathrm{R})$ of the companies in the table. Therefore, the F value proves that there is a significant relationship between the media tone and return. $\mathbf{R}^{2}$ represents the prediction level of variance in return (R) by media tone (MT), whereas the lowest Rsquare is $0.4 \%$ for BOP Company as shown in table 14 above. This means that $0.4 \%$ of R can be predicted from the first lag of MT.

Durbin-Watson (DW) statistics is the ratio of sum of squares of successive differences of residuals to the sum of squares of errors. As a rule of thumb, if the DW statistic is close to 2 , there is evidence of no serial correlation. All of Durbin-Watson statistic were close from 2; it means that there were no high serial correlation residuals of models exception ELECTRODE and ARE.

### 5.5 Hypotheses testing

## H1: There is an adequate media coverage in the local newspaper about the Palestinian stock market.

Based on the results in table (5.12), the total number of occurrence for all listed companies during the four years' period is 9,688 , when the researcher compares this number with the total number of words $(16,143,197)$, the study can conclude that, all listed companies represent 0.0006 (or $0.06 \%$ ) of the total words in the overall text. In addition, the results in table (5.11) show that that total number of
occurrence for the five economic sectors during the four years' period is 31,984 , when the researcher compares this number with the total number of words $(16,143,197)$, the study can conclude that, economics sector names represent 0.0020 (or $0.2 \%$ ) of the total words in the overall text. This shows that media coverage of the listed companies in the market is very poor, and therefore, this hypothesis cannot be accepted

H2: There is a significant positive relationship between media tone in the local newspapers and the trading volume of the stock listed in the market.

Based on the results in table (5.17), the hypothesis can be accepted for 15 companies and rejected for the remaining 34 companies. Table (5.18) shows the results for the 15 companies, which have a significant relationship between media tone and trading volume.

H3: There is a significant positive relationship between media tone in the local newspapers and the returns of the stock listed in the market.

Based on the results in table (5.19), the hypothesis can be accepted for 10 companies and rejected for the remaining 39 companies. Table (5.20) shows the results for the 15 companies, which have a significant relationship between media tone and returns.

H4: There is a significant correlation between media tone in the local newspapers and the stock anomalies (returns and trading volume).

Based on the results in table (5.16), the hypothesis can be accepted for 8 companies and rejected for the remaining 41 companies. From the 8 companies, 4 companies have a significant correlation between the media tone and the trading volume, two have positive correlation coefficient: GCOM ( $\mathrm{r}=0.101$, $\operatorname{sig}=0.004$ ) and PICO (r $=0.499$, sig $=0.042$ ), and two companies have negative correlation coefficient: WATANIYA ( $\mathrm{r}=-0.081, \mathrm{sig}=0.012$ ) and $\boldsymbol{L A D A E N}(\mathrm{r}=-0.171, \mathrm{sig}=$ 0.007 ).

The other 4 companies have a significant correlation between the media tone and returns, one company has positive correlation coefficient: $\boldsymbol{A I B}$ ( $\mathrm{r}=0.075$, $\mathrm{sig}=$ 0.047), and three companies have negative correlation coefficient: $\boldsymbol{T N B}$ ( $\mathrm{r}=-0.078$, $\operatorname{sig}=0.021$ ), AQARIYA $(\mathrm{r}=-0.115, \mathrm{sig}=0.042)$ and $\boldsymbol{E L E C T R O D E}(\mathrm{r}=-0.260, \mathrm{sig}$ $=0.030$ ).

H5: The impact of the media tone in local newspapers on stock trading volume extends for more than a day after the date of publishing.

Based on the results in Table (5.18), the hypothesis cannot be accepted except for two companies only; the first is NIC, which has been affected on the third and fourth days only; and the second is PSE, which has been affected on the first and fourth days only.

H6: The impact of the media tone in local newspapers on stock returns extends for more than a day after the date of publishing.

Based on the results in Table (5.20), the hypothesis cannot be accepted absolutely, because the effect is limited to just one day in all the affected companies.

## Chapter 6

## Conclusion and

## recommendations

## Chapter 6

## Conclusion and recommendations

### 6.1 Conclusion

This research investigates the effects of media tone on stock return and trading volume. The study analyzed the content of economic pages in three Palestinian newspapers, which considered a good representative in public opinion shaping process. To the best of my knowledge, this is the first research in the Arab region that quantifying the financial text to measure the media tone.

The researcher constructed positive and negative word lists, each list consists of 50 word and their most common used derivatives, then he used a software program that support Arabic language to count the number of occurrence for each word and derivative, the counting done on a daily base during the time series of 4 years (2011-2014), this means that, along 1,461 days, the number of occurrence for all the 343 word were counted ( 50 roots and 138 derivatives in positive list, and 50 roots and 105 derivatives in negative list). This mean that about 501,123 data cells in the word frequencies only ( 343 words $* 1,461$ days $=501,123$ data cells).

After counting the words, the researcher used a model that used by (Jegadeesh and Wu 2013) with some modification to determine the weight of each word, and the score of each day.

The data about stock returns and trading volume that provided through PEX website (www.pex.ps) indicate that there were 49 listed companies during the study time series. According to the data, the market was active on 983 days during the study period, this mean that the stock return and trading volume were determined for 49 companies along 983 days, this resulting in 96,334 data cells of stock returns and trading volume, ( 983 days $* 49$ listed companies $* 2$ variables $=96,334$ data cells), the two variable are stock return and trading volume.

The Palestinian stock market is considered as an emerging market, so, the study can conclude that the relationship between media tone and stock anomalies is not obvious to the extent that it can consider the media tone predict stock returns and trading volume.

The correlation analysis shows that only 4 companies have a statistically significance relationship at 0.05 level between media tone and trading volume, two
companies have positive correlation coefficient and the other two companies have negative correlation coefficient. Also only 4 companies have a statistically significance relationship at 0.05 level between media tone and stock returns two companies have positive correlation coefficient and the other two companies have negative correlation coefficient. Statistically. No companies have a statistically significant coefficient in the both cases (trading volume and stock returns).

The multiple linear regression analysis for trading volume shows that only 15 companies have a statistically significance relationship at 0.05 level between media tone and trading volume during the publishing day and 3 lagging days, 4 companies affected on the publishing day only, 3 companies affected on the second day only, 3 companies affected on the third day only, 3 companies affected on the fourth day only, 1 company affected on the third and fourth days, and 1 company affected on the first and the fourth days. The remaining 34 listed companies have no statistically significance relationship at 0.05 level between the media tone and trading volume.

The multiple linear regression analysis for stock returns shows that only 10 companies have a statistically significance relationship at 0.05 level between media tone and stock returns during the publishing day and 3 lagging days, 2 companies affected on the publishing day only, 4 companies affected on the second day only, 2 companies affected on the third day only, and 2 companies affected on the fourth day only. The remaining 39 listed companies have no statistically significance relationship at 0.05 level between the media tone and stock returns.

The results, in general, show the weakness of the impact of the economic media in the three local newspapers on the performance of stocks in terms of trading volume and returns. This is in contrast with the results shown by many of the previous studies, such as (Ammann, Frey et al. 2014), (Ferguson, Philip et al. 2014), (Bosman, Kräussl et al. 2014), (Aromí-IIEP-Baires 2013) and others, which results show that newspaper content is a valuable predictor of stock future anomalies, especially returns. This can be attributed, according to my point of view, to two main reasons: firstly, the weakness of economic media in shaping and orienting the public opinion and influencing it, this is because the small size of spaces which dedicated to the content, and the absence of concentration on the sector of listed companies, a large part of it is interested in international news and another part discusses the general
economic issues such as the siege, closure, poverty, and unemployment. Secondly, the weakness of investment in the local community culture, and the number of the individual investors is limited; in addition, they do not have sufficient awareness and market experience

### 6.2 Recommendations

In light of the obstacles and challenges that the researcher faced in this research, he can summarize the most important recommendations in the following points:

## - Media recommendations

1. The researcher recommends the local media sources to pay more efforts in developing economic media to reflect the changes in the market more effectively and efficiently, issuing of a specialized economic newspaper for PEX and its listed companies similar to those in American and Europe countries (such as wall street, The New York Times, and Financial Time) perhaps helping in that.
2. The researcher recommends the local newspaper to focus more on the local companies and their news, and they should organize and save the soft copy of newspaper in a clear and well-known encoding format to facilitate using them in textual analysis and text mining process.

## - Palestine Exchange Market recommendations

1. The researcher recommends PEX to support and sponsor related research and studies, and working on building a cumulative database about economic media and their statistics that can be used in similar researches later.
2. The researcher recommends PEX to support and sponsor programing engineers to develop a suitable software able to deal with documents written in Arabic language to make textual analysis process more easily in the future.
3. The researcher recommends PEX to give more coordination efforts with media outlets to reach the best economic media coverage. As well as to work for publishing video, audio, and textual media which improve the investment awareness level especially among individuals.

## - Suggestion for future researches:

The researcher recommends the financial management researchers, who interested in the same topic to try applying the study on other markets in the Arab and middle east region, and try to construct a financial dictionary to be used instead of word list such as Harvard IV-4 dictionary used by (Aromí-IIEPBaires 2013), (Ozik and Sadka 2012) and (Tetlock, Saar-Tsechansky et al. 2008).

## Appendix (C): trading volume series

Appendix C: show a sample of most 12 effective companies in the market from 1 January 2011 to 31 December 2014. The data in Table is compatible with trading days in Al-Quds index. (NA) notation offsets the value of trading volume if the stock was not traded in the previous day. The value of trading volume was rounded to 4 digits.

## Appendix (D): return series

Appendix D: show a sample of most 12 effective companies in the market from 1 January 2011 to 31 December 2014. The data in Table is compatible with trading days in Al-Quds index. (NA) notation offsets the value of return if the stock was not traded in the previous day. The value of return was calculated by equation (4.2) and rounded to 4 digits.

## Appendix (E): Positive word series

Appendix E: shows a sample of 4 positive word which have a highest frequency in the economic media from 1 January 2011 to 31 December 2014. Because the volume of the table is very big, the researcher takes one quarter for each year as a sample. The data contain the number of pages in each newspaper and in a total, the total number of words in the economic content in each newspaper and in a total, and the number of occurrence for each word in each newspaper and in a total. The denotations (A), (B), and (C) represent AlHayaa, Al-Ayyam, and Felesteen newspapers respectively.

## Appendix (F): Negative word series

Appendix F: shows a sample of 4 negative words which have a highest frequency in the economic media from 1 January 2011 to 31 December 2014. Because the volume of the table is very big, the researcher takes one quarter for each year as a sample. The data contain the number of pages in each newspaper and in a total, the total number of words in the economic content in each newspaper and in a total, and the number of occurrence for each word in each newspaper and in a total. The denotations (A), (B), and (C) represent AlHayaa, Al-Ayyam, and Felesteen newspapers respectively.
