This Doctoral Dissertation is brought to you for free and open access by the College of Pharmacy at UKnowledge. It has been accepted for inclusion in Theses and Dissertations--Pharmacy by an authorized administrator of UKnowledge. For more information, please contact UKnowledge@lsv.uky.edu.

STUDENT AGREEMENT:

I represent that my thesis or dissertation and abstract are my original work. Proper attribution has been given to all outside sources. I understand that I am solely responsible for obtaining any needed copyright permissions. I have obtained needed written permission statement(s) from the owner(s) of each third-party copyrighted matter to be included in my work, allowing electronic distribution (if such use is not permitted by the fair use doctrine) which will be submitted to UKnowledge as Additional File.

I hereby grant to The University of Kentucky and its agents the irrevocable, non-exclusive, and royalty-free license to archive and make accessible my work in whole or in part in all forms of media, now or hereafter known. I agree that the document mentioned above may be made available immediately for worldwide access unless an embargo applies.

I retain all other ownership rights to the copyright of my work. I also retain the right to use in future works (such as articles or books) all or part of my work. I understand that I am free to register the copyright to my work.

REVIEW, APPROVAL AND ACCEPTANCE

The document mentioned above has been reviewed and accepted by the student's advisor, on behalf of the advisory committee, and by the Director of Graduate Studies (DGS), on behalf of the program; we verify that this is the final, approved version of the student's thesis including all changes required by the advisory committee. The undersigned agree to abide by the statements above.

ABSTRACT OF DISSERTATION

SYNTHESIS AND BIOLOGICAL EVALUATION OF NOVEL RESVERATROL AND COMBRETASTATIN A4 DERIVATIVES AS POTENT ANTI-CANCER AGENTS

Resveratrol has been reported as a potential anticancer agent but cannot be used as an antitumor drug due to its chemical and metabolic instability. We have designed and synthesized 184 novel compounds related to resveratrol in an attempt to produce more potent and drug-like molecules. We have identified a tetrazole analog of resveratrol, ST-145(a) as a lead anticancer agent from the resveratrol analog series of compounds with a GI_{50} value of less than 10nM against almost all the human cancer cell lines in the National Cancer Institute's screening panel.

In a separate study, we tested the hypothesis that the limited bioavailability of resveratrol, can be improved by synthesizing analogs which would be glucuronidated at a lower rate than resveratrol itself. We demonstrated that ST-05 and ST-12(a) exhibit lower glucuronidation profiles when compared to resveratrol and that these synthesized stilbenoids likely represent useful scaffolds for the design of efficacious resveratrol analogs.

We have also initiated a new discovery program to identify selective CB1 and CB2 receptor ligands from a library of novel stilbene scaffolds structurally related to the resveratrol molecule. From the screened resveratrol analogs, two compounds were identified as selective CB2 and CB1 ligands. Compound ST-179 had 47-fold selectivity for CB2 ($K_i = 284$ nM) compared to CB1, while compound ST-160 was 2-fold selective for CB1 ($K_i = 400$ nM) compared to the CB2 receptor. These structural analogs have the potential for development as novel cannabinoid therapeutics for treatment of obesity and/or drug dependency.

Combretastatin A4 (CA-4) is one of the most potent antiangiogenic and antimitotic agents of natural origin. However, CA-4 suffers from chemical instability due to *cis-trans* isomerism in solution. To circumvent this problem, we have developed a facile procedure for the synthesis of novel 4,5-diaryl-2*H*-1,2,3-triazoles as CA-4 analogs to constrain the molecule to its *cis*-configuration. Twenty three triazoles were prepared as CA-4 analogs and submitted for anticancer screening. Among these CA-4 analogs, ST-467 and ST-145(b) can be considered as lead anticancer agents from this series, and further investigation against various cancer cell types in vivo with this class of compound may provide novel therapeutic avenues for treatment.

Keywords: combretastatin, resveratrol, triazole, tetrazole, cannabinoid

DEDICATION

This work is dedicated to my parents (Madadi Venkat Reddy and Madadi Ratnamala), my wife (Madadi Prathibha) and my sister (Yerramreddy Nikitha) for their love, support and patience.

ACKNOWLEDGEMENTS

First of all, I would like to thank my supervisor Dr. Peter A. Crooks for his continuous encouragement and support throughout my graduate studies at the University of Kentucky and at the University of Arkansas for Medical Sciences. Without his guidance and motivational support, this dissertation would not have been possible. He gave me tremendous independence in my research, and expert advice whenever I needed help. I will always be grateful and proud to work under such a highly accomplished and remarkable researcher.

I am further thankful to Dr. Kyung-Bo Kim for agreeing to serve as the co-chair of my committee and providing insightful comments about my project. I would also like to thank Dr. Palli Subba Reddy and Dr. Val Adams for serving as my committee members and for being constructive and supportive during the course of doctoral studies. I am also very grateful to Dr. Isabel Mellon for readily agreeing to serve as my outside examiner. I am greatly privileged to have such a wonderful committee.

Special thanks are due to our collaborator Dr. Paul Prather at the UAMS for giving me the opportunity to work in his lab and for introducing me to cannabinoid receptor studies. I am also thankful to the graduate students Lirit and Max in Dr. Prather's lab for teaching me the lab techniques. I am also very grateful to our collaborator Dr. Radomska Pandya at the UAMS for all the support and encouragement with the resveratrol project discussed in Data Set 1. Her collaborative spirit and enthusiasm are incredible. Thanks are also due to our collaborator Dr. Robert Eoff at the UAMS for helping me with computational docking studies. Dr. Amit Ketkar from Eoff's lab was very helpful with the computational docking studies of CA-4 analogs. Thanks are also due to Dr. Howard Hendrickson and Dr. Lin Song for providing analytical support and for conducting analytical experiments for my projects.

Acknowledgements are also due to our collaborator Dr. Monica Guzman at the Cornell University for carrying out anticancer studies on my compounds. Likewise, gratitude is

also warranted to the National Cancer Institute (NCI) for screening my compounds for anticancer activity and providing such an enormous and useful data set. I would also like to thank Dr. Mark Leggas at the University of Kentucky for doing anticancer screening studies on some of my CA-4 analogs. I would also like to thank Dr. Sean Parkin at the UK for providing crystallographic data on a number of my compounds.

I would also like to thank all my present and past colleagues in Dr. Crooks' lab who turned out to be my friends both in the lab and outside the lab. Special thanks are due to Yerramreddy Thirupathi Reddy for introducing me to practical organic chemistry and for teaching me organic chemistry techniques during my initial days of my graduate studies. I would like to thank Dr. Penthala, Dr. Shoban, Dr. Venu, Dr. Shyam and Dr. Sateesh for being such wonderful friends and lab-mates all these years. Thanks are also due to Dr. Zheng and Dr. Zaineb for being critics of my work and for providing valuable suggestions during group meetings.

Special thanks are also due to my roommates and friends Dr. Satisha U.V. Praveen and Dr. Shyam for being very accommodating during my stay in Little Rock. Acknowledgements are also due to my friends Mahendra, Subramanyam and Ramesh for making my stay in Lexington memorable.

I want to thank my parents (Madadi Venkat Reddy and Madadi Ratnamala) and my sister (Yerramreddy Nikitha) for their love and affection. They have always been there to encourage and inspire me. Last but certainly not least, I wish to thank my wife, Prathiba for her love, encouragement and support.

Chapter 1:

Goals of the study and literature review

1.1 Hypothesis:

The central hypothesis of this work is that the anti-cancer activity, metabolic stability and chemical stability of resveratrol can be improved by structural modification of the stilbene molecule. The second hypothesis of this work was that the anti-cancer activity and chemical stability (*cis-trans* isomerization) of the related compound, combretastatin A4, can be improved by replacing the ethylene bridge with a heterocyclic ring system, thereby constraining the molecule to the *cis* configuration.

1.2 Overall Aims:

Cancer is the second most life threatening disease after cardiovascular disease, affecting more than six million people per year worldwide. Drastic changes in lifestyle during the beginning of 20th century have increased the risk of humans developing different types of cancers. Although to date, significant research has carried out to improve treatment of various forms of cancer, there is still a lack of effective chemotherapeutic treatment to cure most forms of cancer completely. In this respect, considerable effort has been focused on identifying molecules with anti-cancer properties from both natural and synthetic sources. Herein, two medicinal chemistry projects related to the natural product molecules resveratrol and combretastatin A4, both of which possess anticancer properties, are presented.

Resveratrol (3,5,4-trihydroxystilbene) is a well-known phytoalexin found in grapes, peanuts, red wine and other foods. It has been reported as a potential chemotherapeutic agent due to its striking inhibitory effects on cellular events associated with cancer initiation, promotion, and progression. In clinical studies, resveratrol has demonstrated the ability to reduce tumor cell proliferation in patients with colorectal cancer. However, resveratrol has some limitations which preclude its use in cancer treatment, since it cannot be used as a drug because of its chemical and metabolic instability. This project has been designed to improve the chemical and metabolic stability and the anti-cancer potency of the resveratrol molecule with structural modifications designed to make the molecule more drug like.

Combretastatin A4 (CA-4), a natural product structurally related the resveratrol molecule was first isolated from the South African willow tree, *combretum caffrum*, by Pettit and co-workers (Pettit, Singh et al. 1995). It is one of the most potent antiangiogenic and antimitotic agents of natural origin. Combretastatin A4 is structurally and functionally similar to a well-known microtubule-targeting agent, colchicine. Its phosphate prodrug (CA-4P) is currently in phase 3 clinical trial for the treatment of anaplastic thyroid cancer, and it has successfully retarded tumor growth in a wide spectrum of tumor models. However, recent studies have reported the chemical instability of CA-4 due to *cis-trans* isomerization to the more thermodynamically stable, but less potent *trans*-CA-4 isomer (Nathwani, Hughes et al. 2013). This project has been designed to improve the chemical stability and the anti-cancer potency of the resveratrol molecule with structural modifications designed to constrict the *cis* configuration of CA-4.

Figure 1.1 Structure of resveratrol and Combretastatin A4

1.3 Introduction to cancer

Cancer is the second most common cause of death in America after cardiovascular disease. About 567,628 Americans died of cancer in 2009 alone, almost 11,000 per week. About 23 % of deaths in the United States during 2008-2009 were caused by cancer (Heron 2012). The cost for the treatment of cancer in the US in 2009 was estimated to be \$216.6 billion and was expected to double over the next few years. Thus, curing cancer is one of the biggest challenges the scientific community is facing in the 21st century.

Cancer is a disease characterized by unrestrained growth and abnormal spread of cells. If the invasion of these abnormal cells to other tissues is not controlled, it may lead to death. This abnormality in the cells can be caused by both internal stimuli (hormones, immune system, inherited mutations and mutations from metabolism) and external stimuli (chemicals, radiation, infectious microorganisms). Both the internal and external factors may act together to initiate the development of cancer (Heron 2012).

1.4 Natural products as anti-cancer drugs

Since 1940, a systematic search for novel natural products with interesting biological properties has been initiated by pharmaceutical organizations and health institutes all around the world. By 1958 Charles Beer had isolated a pure compound from the leaves of the Madagascar periwinkle that depleted white cells and named the compound vinblastine (Noble, Beer et al. 1959). During the same period, the Eli Lilly Company discovered that vinblastine prolonged the life of mice carrying the leukemia cell line P1534. Vinblastine is currently being used in the treatment of testicular teratoma and Hodgkin's lymphoma (Gobbi, Broglia et al. 2003). Later, another *Vinca* alkaloid, vincristine was isolated which was used to treat a host of rare childhood cancers such as Wilms tumour, neuroblastoma, rhabdomyosarcoma and Ewing's sarcoma (Johnson, Armstrong et al. 1963).

Figure 1.2 Structures of Vinblastine and Vincristine.

1966, and its water soluble analogues, topotecan and irinotecan (**Figure 1.4**) are used in the treatment of colon and ovarian cancer, respectively (Thomas, Rahier et al. 2004).

Figure 1.4 Structures of Camptothecin, Topotecan and Irinotecan.

The discovery of penicillium by Fleming in 1928 lead scientists to look into microorganisms as a source of useful natural products and this led to the discovery of several anticancer agents. In 1960, Dr. Farber discovered the anticancer properties of actinomycin D (**Figure 1.5**) and reported its potential for treating Wilms tumour in children (Farber, D'Angio et al. 1960). The discovery of actinomycin D introduced a new class of antitumor agents from microorganisms.

Figure 1.5: Structures of Actinomycin D and Mitomycin C.

Mitomycin C was first isolated by Wakaki from *Streptomyces caespitosus* in 1958. It was found to be highly toxic towards cancer cells but lacked selectivity, causing bone-marrow depression, vomiting, and kidney, liver and heart toxicity. The toxicity of mitomycin C was attributed to its bio-reduced product, which can form covalent bonds to DNA, similar to alkylating agents (Nguy, Chiu et al. 1987).

Anthracyclines are a more useful class of anticancer antibiotics. The Arcamone group first isolated them in the early 1960s, and they were found to possess potent antitumor properties. In the coming years, hundreds of analogues were synthesized and developed to yield drugs such as Doxorubicin and Daunorubicin, with a broad spectrum of anticancer activity (Arcamone, Franceschi et al. 1964).

Figure 1.6 Structures of Daunorubicin and Doxorubicin.

Another area of developing anticancer agents is the use of hormone mimics. In the early 1930s Dodd and coworkers reported that a dimer of *p*-propenyl phenol had potent oestrogenic activity and mimicked the activity of estrogen (Hasenbrink, Sievernich et al. 2006). This led to the synthesis of a series of dimeric structures, among which diethylstilbestrol was found to be a potent compound against breast cancer. Further modifications to the diethylstilbestrol structure led to the discovery of Tamoxifen (Early Breast Cancer Trialists' Collaborative 1992).

Figure 1.7 Structures of *p*-Propenyl phenol, Diethylstilbestrol, Tamoxifen and Glivec.

The initial discoveries in the field of chemotherapy were mostly cytotoxic agents with little selectivity for cancer cells. However, as our understanding of cancer improved, complimented with computational docking studies, high throughput screening protocols and bioinformatics, chemotherapy is now becoming more selective in targeting cancer cells.

By 2001, the first target-based cancer drug, Gleevec (**Figure 1.7**), was approved by the FDA for the treatment of chronic myelogenous leukemia (CML). If treated with Gleevec in the early stages of CML, nearly 100% of the diagnosed patients went into remission, and no major side effects were reported (Capdeville, Buchdunger et al. 2002).

Cancer chemotherapy is used as the primary mode of treatment for cancer and is also utilized as an adjuvant to other treatment options. However, it often is associated with

side effects and poor selectivity. Throughout history, natural products have been a rich source of compounds with excellent pharmacological activities and few side effects. The huge structural diversity of natural products isolated from natural sources can serve as lead compounds for the discovery of new anticancer agents, and their potencies and drug likeness properties can be further optimized by appropriate chemical modifications. Most of the anticancer drugs currently available on the market are from natural sources (Gordaliza 2007). The search for potent and selective semi-synthetically derived anticancer agents from parent natural products continues to be an important part of drug discovery process. Currently, close to 30 molecules of natural origin are in various stages of clinical trials for the treatment of cancer. Researchers and pharmaceutical companies devoted to the search for new cancer drugs are exploring new natural products emerging from variable sources, with the hope of finding potent, selective, drug-like and non-toxic molecules.

There are more than 100 types of malignancies that have been recognized to date. Almost any cell types can become cancerous (Heron 2012). In the last 50 years our understanding of cancer has improved greatly, but many forms of cancer still lack effective treatment options. In an effort to find anticancer drug leads, pharmaceutical companies often screen large chemical libraries which include natural products. Natural products are a rich source of complex molecules that are biologically relevant. The method used to develop new drugs from a prototype or a lead molecule of known biological activity is known as pharmacomodulation. The main aim of pharmacomodulation is to establish a correlation between the pharmacophore in the structure and its biological activity. By understanding the structure activity relationships (SAR) of the natural product and its analogs, by semi-

synthetically altering the functional groups in the molecule, additionally complimented with high throughput screening protocols, computational docking studies and bioinformatics, medicinal chemists can produce compounds that are far more effective as clinical agents in terms of potency and pharmacokinetic parameters.

1.5 National Cancer institute (NCI) Anticancer screening program

Screening natural products from different sources for activity against various human cancer cells gained momentum after the discovery of vinblastine in the 1950s. The National Cancer Institute (NCI) has been screening thousands of natural products and their derivatives and has been encouraging researchers to submit semi-synthetically produced derivatives for testing against its panel of 60 human tumor cell lines of nine different classifications (Rubinstein, Shoemaker et al. 1990). Numerous anticancer drugs have been discovered because of the NCI initiative, e.g. paclitaxel, docetaxel, irinotecan and topotecan (Shoemaker 2006). The successful discovery of these agents demonstrates the potential of natural products in the treatment of cancer.

Since 1955, the NCI has employed both *in vitro* and *in vivo* screens to evaluate the activity of natural products, their analogs, and novel synthetic compounds. Up until 1990, the NCI used the P388 mouse leukemia cell line to assess the activity of submitted compounds (Boyd and Paull 1995). From 1991 onwards the NCI introduced a panel of 60 human cancer cell lines of nine different classifications for its *in vitro* screens. The classifications represent human cancer lines from leukemia, non-small cell lung, colon, CNS, melanoma, ovarian, renal, prostate, and breast cancers. Five different

concentrations, viz. 10^{-4} M, 10^{-5} M, 10^{-6} M, 10^{-7} M and 10^{-8} M, of the compounds are used to evaluate their growth inhibition properties after 48 hours of exposure to cells in culture. The NCI employs an effective triage system for the submitted compounds based on duplicates already screened and single dose screening results, prior to selecting them for five dose testing. According to Rubinstein et al. anti-cancer activity screening studies involves a two stage process in which only the compounds showing more than 60% growth inhibition in at least eight of the 60 tumor cell line panel with a single dose of $10\mu\text{M}$ are selected for the second stage (five dose testing) (Rubinstein, Shoemaker et al. 1990). The Sulforhodamine B (SRB) assay is used to quantify the cell growth and viability effects of the test compounds. SRB is a chemical which stains basic amino acids to afford a pink colored product in mild acidic conditions allowing colorimetric quantitation, which is proportional to the total biomass. The collected data, when compared to control cells, allows the determination of GI_{50} values (i.e. 50% Growth Inhibition, concentration of drug resulting in a 50% reduction in net protein increase compared to control cells), TGI values (Total Growth Inhibition, concentration of drug resulting in a 100% reduction in net protein increase compared with control cells) and LC_{50} values (Lethal Concentration, concentration of drug lethal to 50% of cells). The screens have identified many potent anticancer drugs, and on average, every year NCI screens close to 10,000 novel compounds against its 60 human cancer cells. We have utilized the NCI 60-cell cancer screen to gather large quantities of useful biological data for the synthesized molecules in this dissertation project against various human tumor cell lines.

Herein, two medicinal chemistry projects related to the natural product molecules resveratrol and combretastatin, which possess anticancer properties, are presented. The projects were designed to improve the chemical/metabolic stability and pharmacokinetic properties of the above-mentioned drug molecules.

1.6 Introduction to resveratrol

Figure 1.8 Structure of resveratrol

The use of resveratrol in an ayurvedic herbal preparation can be dated back to thousands of years ago. Darakchasava is an ayurvedic herbal preparation of which the main ingredient is *Vitis vinifera L* (Baur, Pearson et al. 2006). This ayurvedic medicine was prescribed to patients with cardiovascular ailments. High performance liquid chromatography studies on darakchasava revealed the active ingredient to be resveratrol (Paul, Masih et al. 1999). Resveratrol (**Figure 1.8**) is a naturally occurring *E*-3,5,4'-trihydroxystilbene that was first isolated from the roots of white hellebore in 1940 (Baur and Sinclair 2006). The phytoalexin (resveratrol) is produced by a wide variety of plants in response to injury, stress, microbial infection and UV irradiation (Aggarwal, Takada et al. 2004). Although, red grapes have the highest concentration of resveratrol (50-100 mg

per gram) in the plant kingdom, Resveratrol was found in more than 80 plant species (Figure 1.9) (Baur and Sinclair 2006).

Figure 1.9 Sources of resveratrol from various plant species.

Resveratrol received tremendous attention after it was credited for the cardio-protective effects of red wine, famously known as the ‘French paradox’ (Kopp 1998). In 1997, Jang and coworkers reported that the topical application of resveratrol reduced mouse skin tumors to 2%, triggering extensive research on resveratrol (Jang, Cai et al. 1997). Since then, hundreds of reports (Figure 1.10) have shown that resveratrol can be used to treat a wide variety of diseases including cancer. Resveratrol has been reported as a potential chemotherapeutic agent due to its striking inhibitory effects on cellular events associated with cancer initiation, promotion, and progression *in vitro* (Aggarwal, Bhardwaj et al. 2004). In addition, there are several *in vitro* and *in vivo* reports on the biologically beneficial properties of resveratrol for coronary, hepatic, neurological, cardiovascular,

and inflammation conditions (Pace-Asciak, Rounova et al. 1996, Fauconneau, Waffo-Teguo et al. 1997, Jang, Kang et al. 1999, Aggarwal, Bhardwaj et al. 2004, Kim, Zhu et al. 2006). Also, resveratrol synergistically enhanced the anti-HIV activity of zidovudine, and has antiviral effects against the herpes simplex virus (Docherty, Fu et al. 1999, Heredia, Davis et al. 2000).

Below is a list of breakthrough findings on resveratrol's biological properties.

- 1) Resveratrol modulates low-density lipoprotein levels, reducing the risk for development of coronary heart disease (Frankel, Waterhouse et al. 1993).
- 2) Resveratrol reduced mouse skin tumors by 98%, indicating its chemo-preventive effects (Jang, Cai et al. 1997).
- 3) Resveratrol extends the life span of yeast, giving a boost to the sales of resveratrol supplements (Howitz, Bitterman et al. 2003).
- 4) Resveratrol has a positive effect on obesity and diabetes (Baur, Pearson et al. 2006) (Lagouge, Argmann et al. 2006).

Figure 1.10 Resveratrol citations appearing on Pubmed from 1978 to 2013. The PubMed database was searched using the key word ‘resveratrol’.

1.6.1 Molecular targets of resveratrol:

Extensive studies have been conducted to elucidate the mechanism of resveratrol as an anticancer agent. The studies revealed multiple molecular targets, which regulate cell growth, invasion, apoptosis, angiogenesis and metastasis. Resveratrol’s direct and indirect targets include tumor suppressors p53 and Rb; cell cycle regulator cyclins, CDKs, p21WAF1, p27KIP and INK and the checkpoint kinases ATM/ATR; transcription factors NFκB, AP-1, c- Jun, and c-Fos; angiogenic and metastatic factors, VEGF and matrix metalloprotease 2/9; cyclooxygenases for inflammation; and apoptotic and survival regulators Bax, Bak, PUMA, Noxa, TRAIL, APAF, survivin, Akt, Bcl2 and Bcl-XL (Athar, Back et al. 2009). In addition to these targets, resveratrol is known to exhibit pro-oxidant activity in cancer cells causing apoptosis (Seve, Chimienti et al. 2005). Resveratrol is an ideal anticancer molecule due to its low toxicity and capacity to target

multiple molecular targets that may collectively promote cancerous cell growth and invasion. Since resveratrol is known to regulate multiple molecular targets and signaling pathways, it is important to elucidate the mechanism by which resveratrol influences these molecular targets. One assumption is that the resveratrol may act as an endogenous signaling molecule, or act through generation of mediators such as reactive oxygen species (ROS), or both (Athar, Back et al. 2009). The biological effects and molecular targets of resveratrol against various tumor cell lines are summarized in **Table 1.1**.

Table 1.1 Effects of resveratrol on various human cancer cell lines. Adapted from (Athar, Back et al. 2009)

1.6.2 Pharmacokinetics of resveratrol:

Nearly all the reports claiming the biologically beneficial effects of resveratrol to date have been generated *in vitro* and in animal models. Thus, it is still unclear if these claims can be translated to humans. At higher doses, protective effects of resveratrol were observed. For example, a daily dose of 40 mg/kg increased the survival of mice with subcutaneous neuroblastomas from 0% to 70% (Chen, Tseng et al. 2004). However, in many *in vivo* studies, no notable chemopreventive effect of resveratrol was observed in animal models. For example, treatment with 1-5 mg/kg daily dose of resveratrol failed to affect the metastasis of breast cancer in mice, despite encouraging *in vitro* results. In one recent study, resveratrol acted as an ant-proliferative agent against ovarian cancer cells *in vitro*, but failed to exhibit this effect on the same cancerous cells *in vivo* (Bove, Lincoln et al. 2002). Overall, numerous *in vitro* studies clearly showed promising results, but the drug did not yield consistent results *in vivo*.

The pharmacokinetic data of resveratrol reported in the literature is both confusing and contradicting. The high doses of resveratrol used in animal models (for example 100 ng - 1500 mg/Kg body weight) to achieve pharmacologically relevant concentration in plasma raises many questions about its translational effectiveness in humans. Resveratrol was found to have a short half-life of 8-10 min after oral administration, and was extensively metabolized to both sulfate and glucuronide phase 2 conjugates (Marier, Vachon et al. 2002). In the case of intravenous administration, resveratrol was completely converted to sulfate conjugates within 30 min in humans (Walle, Hsieh et al. 2004). The maximum tolerated dose of resveratrol has not been comprehensively determined; however,

300mg/Kg (body weight) showed no toxicity in rats, but toxic effects related to the kidney have been observed at 1 gram/Kg (body weight) (Crowell, Korytko et al. 2004).

Despite resveratrol's low bioavailability, it was speculated that the *in vivo* efficacy of resveratrol could be attributed to its metabolites. However, when resveratrol-3-sulfate was tested *in vitro* it failed to activate SIRT1 and inhibit cyclooxygenase (Yu, Shin et al. 2003). Another speculation is that the inactive metabolites of resveratrol could act as pool from which the resveratrol can be released into the tissues and stimulate the biological activity; however, no data on such findings have been reported.

Because of the extremely low bioavailability and rapid clearance from the circulation, resveratrol could not be used as a drug. One approach to addressing this problem is to modify resveratrol's structure to create analogs which would be metabolized at a slower rate than resveratrol itself (Greer, Madadi et al. 2014). Another approach is to synthesize potent resveratrol analogs that mimic its effect with improved bioavailability (Aggarwal, Takada et al. 2004). In the following chapters, both of these approaches have been tested.

1.7 Introduction to Combretastatin A4

Microtubules are believed to be one of the most promising targets for cancer chemotherapy since the tubulin interacting agent paclitaxel (**Figure 1.13**) was approved by the FDA for cancer treatment. Since then, the interest in tubulin targeting agents has significantly increased. Between 2007 and 2009, over 25% of the drug molecules that

entered clinical study were tubulin targeting agents (Butler 2008), and almost all of these drug molecules were natural products or analogs thereof.

It is important to evaluate the role of tubulin in the life cycle of the cell in order to understand the mechanism of action of tubulin targeting anti-cancer agents. The cytoskeleton present in the cytoplasm of eukaryotic cells is responsible for the organization of constituents of the cell, maintains cell shape and the movement of the various organelles within the cell. There are three types of filaments or fibers that make up the cytoskeleton: they are the microfilaments, the intermediate filaments and the microtubules. Microtubules comprise of $\alpha\beta$ -tubulin heterodimers and play an important role in cell division, cellular transport, and cell mortality, maintaining cell polarity and cell signaling (Jordan, Hadfield et al. 1998, Zhou and Giannakakou 2005). Microtubule polymerization involves coordinated assembly of $\alpha\beta$ -tubulin dimers followed by GTP hydrolysis. Each α and β subunit of the heterodimer has one GTP molecule bound to it; the GTP attached to the α subunit is irreversible, whereas the GTP molecule attached to the β subunit is reversibly hydrolyzed during polymerization (Nogales, Wolf et al. 1998). Compromised or non-coordinated microtubule functioning may lead to apoptosis.

There are mainly three phases of microtubule polymerization

1. Nucleation (an oligomer consisting of 6-12 $\alpha\beta$ -tubulin heterodimers is formed)
2. Polymer growth (a protofilament is formed where the GTP binds to $\alpha\beta$ -tubulin dimers)

3. Steady-state equilibrium (addition and dissociation of tubulin subunits is balanced)

Treadmilling and dynamic instability are the two types of microtubule dynamics observed. In the treadmilling dynamics the subunits from the minus end of the microtubule flow to the plus end; this dynamics doesn't change the average length of the microtubules. On the other hand, dynamic instability is associated with alternative growth and shortening microtubule ends (Mitchison and Kirschner 1984). The transition from a growing phase to a shortening phase is termed as "catastrophe" and the transition from a shortening phase to a growing phase as "rescue", **Figure 1.13** illustrates the necessity for GTP hydrolysis for switching between catastrophe and rescue. Microtubules are stabilized and destabilized by microtubule-associated proteins (MAP). MAPs such as plus and tracking proteins (TIP) interact with the microtubule ends to regulate the microtubule dynamics (Akhmanova and Steinmetz 2008). Since the microtubule dynamics play an important role in mitosis and basic cellular functions, microtubule targeting drugs are used in the treatment of various forms of cancer (Jordan and Wilson 2004, Singh, Rathinasamy et al. 2008).

Figure 1.11 Microtubule dynamic instability, where the coexistence of polymerization and depolymerizing microtubules are imperative for dynamic stability.

Anticancer agents that have polymerizing and depolymerizing effects on tubulin assembly are known as Microtubule-interfering Agents (MIA). Both polymerization and depolymerization impairs the proper function of microtubules and stagnates the cell cycle at G2/M phase leading to apoptosis (Li, Wu et al. 2009). Anticancer drugs such as colchicine, vinblastine and vincristine act by depolymerizing mechanism, whereas drugs such as paclitaxel and docetaxel act through a polymerizing effect. There are many tubulin binding sites for the depolymerizing agents, such as the colchicine and the vinblastine binding sites (Ravelli, Gigant et al. 2004, Gigant, Wang et al. 2005). Additionally, when depolymerization agents such as estramustine and LY290181 (**Figure 1.12**) were treated with tubulin, they did not compete for the colchicine and vinblastine binding sites. Also, Chakraborti *et al.* using fluorescence spectroscopy, demonstrated that curcumin binds to tubulin at a site which is close to the vinblastine binding site

(Chakraborti, Das et al. 2011). This experiment suggests that each of these depolymerization agents have distinct binding site (Singh, Rathinasamy et al. 2008).

Figure 1.12 Structures of polymerizing and depolymerizing agents on tubulin assembly.

Microtubule targeting agents act as anticancer agents by causing the cells to arrest at the G2/M stage of the cell cycle promoting apoptosis, and/or by their vascular disrupting action. However, the mechanism by which they act is poorly understood. The relationship between mitotic block and apoptosis caused by 2',3,4,4',5-pentamethoxy-*trans*-stilbene (PMS) (**Figure 1.13**) was studied by Li and co-workers. The experiments suggested that

hyper phosphorylation of CDC2 or JNK by Bcl-2/Bcl-xL and activation of Bim by JNK could be a link between mitotic block and apoptosis (Li, Wu et al. 2009). Also, caspase-8 activation was observed during paclitaxel-induced apoptosis (Goncalves, Braguer et al. 2000).

Interestingly, there is also a strong correlation between microtubule targeting agents and their vascular disruption properties (Mason, Zhao et al. 2011). Anticancer agents that target the tumor vasculature are known as vascular-targeting agents (VTAs) and can be divided into two categories. They are

- (a) Vascular disrupting agents (VDAs). Example: Combretastatin A4.
- (b) Angiogenesis inhibiting agents (AIA). Example: Bevacizumab.

VDAs like combretastatin A4 influence tubulin polymerization by damaging the proliferating endothelial cells of the cancer vasculature, thereby decreasing blood flow to the tumor cells leading to cell death. VDAs like combretastatin A4 also have potential curative activities in retinal and choroidal neovascularization related diseases, since angiogenesis plays a key role in these disease conditions (Nambu, Nambu et al. 2003, Jockovich, Suarez et al. 2007).

A total of seventeen combretastatin compounds have been isolated from the South African bushwillow tree *Combretum caffrum* by Pettit and co-workers (Pettit, Singh et al. 1995). Among these compounds, a *cis*-stilbene: Combretastatin A4 (3'-hydroxy-3,4,4',5-tetramethoxy-*cis*-stilbene; CA-4; **Figure 1.13**), has emerged as a potent anti-cancer agent with promising anti-mitotic and anti-angiogenic activity (Tron, Pirali et al. 2006). CA4 functions as a microtubule targeting agent, interfering with microtubule dynamics and

perturbation of the mitotic cycle. Moreover, CA4 selectively inhibits the formation of new blood vessels in cancerous cells, sparing the normal cell population (Thorpe 2004).

Figure 1.13 Structures of Combretastatin A4 (CA4), CA4P and PMS.

CA4 is well known anticancer agent for inhibition of tubulin polymerization *in vitro*. CA4 binds to the β -tubulin at the colchicine binding site, promoting the disturbance of the dynamic equilibrium of microtubule formation (Mikstacka, Stefanski et al. 2013). Also, CA4 exerts its antitumor effects against multi-drug resistant (MDR) cancer cells (Chaudhary, Pandeya et al. 2007). However, CA4 itself cannot be used as a drug because of its poor water solubility leading to low bioavailability, and due to its chemical instability, since it forms the thermodynamically more stable and less potent *trans* CA4 (Hsieh, Liou et al. 2005) isomer. The low bioavailability of CA4 was addressed by preparing the water soluble phosphate salt (disodium CA-4-3-O-phosphate) of CA4 (CA4P). Currently, CA4P (**Figure 1.13**) has been moved into phase III clinical trial by the pharmaceutical company OXiGENE for the treatment of anaplastic thyroid cancer (Siemann, Chaplin et al. 2009). Another approach utilized for improving the bioavailability of CA4 was to prepare nitrothiophene ether-linked conjugates of CA4, which could function as bioreductively activated prodrugs (Thomson, Naylor et al. 2006).

Also, formulations that employ nanoparticles to selectively deliver CA4 and improve its bioavailability have also been reported (Calligaris, Verdier-Pinard et al. 2010).

The chemical instability (isomerization) of CA4 has been addressed by designing and synthesizing a series of *cis*-constrained derivatives of CA4. Extensive studies have been conducted to stabilize CA4 by replacing the double bond bridge with heterocyclic ring systems such as β -lactam, azetidone, thiazoles, tetrazoles, imidazoles, pyrazoles, oxazolones, triazoles, and furanones (Shirai, Takayama et al. 1998, Tron, Pagliai et al. 2005, Carr, Greene et al. 2010, Beale, Bond et al. 2012, Banimustafa, Kheirollahi et al. 2013, Mikstacka, Stefanski et al. 2013, Demchuk, Samet et al. 2014).

Our approach is to design and synthesize triazole modified CA4 analogues that are more water soluble and also incapable of undergoing *cis-trans* isomerization of CA4.

Chapter 2

Synthesis of resveratrol analogues as anti-cancer agents

2.1 Previous SAR studies on resveratrol analogues

Resveratrol binds with multiple molecular targets *in vitro*, and exhibits cytotoxic effects against breast, skin, gastric, colon, esophageal, prostate, and pancreatic cancer cells, and leukemia cells (Jang, Cai et al. 1997, Aggarwal, Bhardwaj et al. 2004). However, resveratrol has some limitations which preclude its use in cancer treatment, and it cannot be used as an antitumor drug due to its photosensitivity and metabolic instability (Goldberg, Ng et al. 1995). Literature results indicate that the *in vivo* effectiveness of resveratrol in animal models is limited by its poor systemic bioavailability (Athar, Back et al. 2009). Thus, there is a need for the design and synthesis of novel resveratrol analogs that retain the potent anti-cancer agents of the parent compound, have good chemical and metabolic stability, and are devoid of photosensitivity problems.

Extensive structure activity relationship (SAR) studies on the resveratrol molecule for its anticancer activity and chemical/metabolic stability have been conducted on synthetically prepared derivatives and natural products which resemble resveratrol. The studies revealed that maintaining the stilbene skeleton is necessary for good metabolic stability and for retaining resveratrol's medicinal properties. Also, replacing the extensively metabolized hydroxyl groups with methoxyl groups improves resveratrol's bioavailability.

Wang and co-workers compared the anticancer effects of resveratrol and its natural derivatives pterostilbene, *trans*-3,5,4'-trimethoxy-stilbene, pinostilbene and desoxyrhapontigenin against human prostate cancer cell line LNCaP (**Figure 2.1**). They reported that *trans*-3,5,4'-trimethoxy-stilbene was the most effective compound among resveratrol and its natural derivatives, causing G2/M blockage in the cell cycle leading to apoptosis (Wang, Schoene et al. 2010).

Figure 2.1 Structures of resveratrol and its O-methylated derivatives.

Chen and co-workers synthesized and evaluated a series of methoxylated resveratrol derivatives for their anti-cancer properties against three different human cancer cell lines, i.e. K562, HT29, and HePG2. They reported that *trans*-3,5,4'-trimethoxy-stilbene

(TMR) and *trans*-3,4,5,4'-trimethoxy-stilbene (**Figure 2.1**) were the most effective anti-cancer agents among the synthesized analogs and showed better cytotoxicity compared to resveratrol itself. SAR analysis revealed that methoxy substitutions at positions 3, 4, and 5 on the A ring and at position 4' of the B ring promoted cytotoxicity, and that incorporation of halogeno substituents such as bromo, chloro and fluoro, or nitro groups into the B ring was detrimental to anticancer activity (Chen, Hu et al. 2013).

Dias et al. evaluated resveratrol, *trans*-3,5,4'-trimethoxystilbene (TMR), piceatannol, pterostilbene, *trans*-3,5-diacetyl-4' hydroxyl stilbene, and *trans*-3,5,4'-triacetylstilbene, and characterized their effects on PCa cells in vitro using a cell proliferation assay. Also, they compared the chemopreventative effects of oral resveratrol, *trans*-3,5,4'-trimethoxystilbene, piceatannol in LNCaP-Luc xenografts. Among all these stilbenes examined, *trans*-3,5,4'-trimethoxystilbene was the most potent in inhibiting cell proliferation, and its permeability into the tumor tissues was the highest (Dias, Li et al. 2013).

Figure 2.2 Isomerization of *cis*-3,5,4'-trimethoxystilbene to *trans*-3,5,4'-trimethoxystilbene.

Paul et al. compared the anticancer activity of *trans*-3,5,4'-trimethoxystilbene with *cis*-3,5,4'-trimethoxystilbene against the colon cancer cell lines HT-29 and Caco-2. Also, *in vivo* studies using HT-29 xenografts in immunodeficient mice were conducted with both these isomers. Tumor volume was significantly lowered in groups of mice when *trans*-3,5,4'-trimethoxystilbene was used compared to *cis*-3,5,4'-trimethoxystilbene, Also *cis*-3,5,4'-trimethoxystilbene was found to be chemically unstable and isomerized to *trans*-3,5,4'-trimethoxystilbene in solution (Paul, Mizuno et al. 2010).

From these studies, it is evident that *trans*-3,5,4'-trimethoxystilbene (TMR) is the most potent and stable analog of resveratrol, and has better bioavailability than resveratrol. *Trans*-3,5,4'-trimethoxy-stilbene is a natural resveratrol analogue extracted from the plant species *Pterobolium hexapetallum* (Aggarwal, Bhardwaj et al. 2004) and the molecule has been reported to have anticancer and antiangiogenic activities (Belleri, Ribatti et al. 2005). The trimethoxylated substitution pattern on *trans*-3,5,4'-trimethoxystilbene molecule might improve metabolic stability and intestinal absorption. Moreover, conversion of the phenolic substituents to methoxy substituents increases the lipophilicity and cell membrane permeability properties of the molecule and enhances bioavailability.

2.2 Synthesis of (*E*)-stilbenes as resveratrol analogues

Based on the structure-activity relationship analysis reported previously, it is evident that O-methylation of resveratrol leads to an enhanced cytotoxic activity. In our continuing

quest for improving the potencies of our newly identified lead anti-cancer agents, we have synthesized a wide range of such (*E*)-stilbene resveratrol analogs.

Scheme 2.1 Synthesis of (*E*)-stilbenes as resveratrol analogues. Reagents and conditions: (a) 5% NaOMe, MeOH, reflux.

The general procedure for the synthesis of *trans* 2,3-disubstituted stilbenes is illustrated in **Scheme 2.1**. *Trans* 2,3-disubstituted stilbenes were synthesized by reacting substituted benzyl carbaldehydes (1 mmol) with an appropriately substituted benzyl Wittig salt (1.2 mmol) in 5% NaOMe in methanol. The reaction mixture was stirred at room temperature for about 2-3 hours for the reaction to come to completion and the final product crashed out of the solution. The resulting precipitate was filtered, washed with methanol, then water and dried to yield the desired compound in yields ranging from 60-75% (Scheme 2.1). If necessary, further purification can be carried out by flash column chromatography. The minor *cis*-stilbene product could be separated during the filtration and methanol wash. A total of seventy four *trans* stilbenes were synthesized via this general procedure and their structures are presented in **Table 2.1**.

Table 2.1: Structures of the synthesized *trans*-stilbenes and the starting materials (benzyl carbaldehyde and Wittig salt) used.

2.2.1 Analytical data for the synthesized *trans*-stilbene analogues

ST-196 : ^1H NMR (400 MHz, DMSO- d_6): δ 3.68 (s, 3H, -OCH₃), 3.84 (s, 6H, -OCH₃), 3.85 (s, 3H, -OCH₃), 6.98 (s, 2H, -ArH), 7.34 (d, J =7.2 Hz, 2H, ArH), 7.72 (d, J =8.4 Hz, 2H, ArH), 7.968 (d, J =8 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 52.4, 56.3, 60.5, 60.5, 104.76, 126.8, 127.0, 128.4, 130.1, 131.9, 132.6, 142.4, 153.5, 166.4 ppm.

ST-192 : ^1H NMR (400 MHz, DMSO- d_6): δ 1.32 (t, J =12.8 Hz, 3H, -CH₃), 4.03 (d, J =6.8 Hz, 2H, -CH₂), 6.02 (s, 2H, -CH₂), 6.91 (d, J =6.8 Hz, 3H, ArH), 6.96-7.02 (m, 3H, ArH), 7.22 (s, 1H, ArH), 7.47 (d, J =7.6 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 15.0, 63.4, 101.4, 105.5, 108.7, 115.0, 121.5, 126.2, 126.7, 127.9, 130.1, 132.4, 147.0, 148.2, 158.4 ppm.

ST-191 : ^1H NMR (400 MHz, DMSO- d_6): δ 6.04 (s, 2H, -CH₂), 6.92 (d, J =8 Hz, 1H, ArH), 7.02 (d, J =9.2 Hz, 1H, ArH), 7.12 (s, 2H, ArH), 7.18 (t, J =17.6 Hz, 2H, ArH), 7.26 (d, J =1.2 Hz, 1H, ArH), 7.06-7.57 (m, 2H, ArH) ppm. ^{13}C NMR (100 MHz,

DMSO- d_6): 101.5, 105.6, 108.8, 115.8, 116.0, 122.0, 125.9, 128.4, 128.5, 128.5, 131.9, 134.3, 147.3, 148.3 ppm.

ST-193 : ^1H NMR (400 MHz, DMSO- d_6): δ 6.04 (s, 2H, -CH₂), 6.92 (d, J = 7.6 Hz, 1H, ArH), 7.04 (d, J = 9.2 Hz, 1H, ArH), 7.12 (d, J = 16.4 Hz, 1H, ArH), 7.21 (d, J = 16.4 Hz, 1H, ArH), 7.27 (d, J = 1.2 Hz, 1H, ArH), 7.41 (d, J = 8.8 Hz, 2H, ArH), 7.57 (d, J = 8.8 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 101.6, 105.8, 108.8, 122.3, 125.7, 128.2, 129.0, 129.5, 131.7, 131.9, 136.6, 147.5, 148.3 ppm.

ST-188 : ^1H NMR (400 MHz, DMSO- d_6): δ 2.38 (s, 3H, CH₃), 6.04 (s, 2H, -CH₂), 6.92 (d, J = 8 Hz, 1H, ArH), 7.05-7.01 (m, 2H, ArH), 7.14-7.19 (m, 3H, ArH), 7.28 (d, J = 16.0 Hz, 1H, ArH), 7.33 (d, J = 1.6 Hz, 1H, ArH), 7.61 (d, J = 6.8 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 19.9, 101.5, 106.0, 108.7, 122.1, 124.6, 125.2, 126.5, 127.6, 129.8, 130.7, 132.3, 135.7, 136.4, 147.3, 148.3 ppm.

ST-186: ^1H NMR (400 MHz, DMSO- d_6): δ 3.76 (s, 3H, -OCH₃), 6.02 (s, 2H, -ArH), 6.88-6.93 (m, 3H, ArH), 6.97-7.04 (m, 3H, ArH), 7.23 (s, 1H, -ArH), 7.49 (d, J = 8.8 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.5, 55.6, 101.4, 105.5, 108.8, 114.5, 121.6, 126.3, 126.7, 127.9, 130.3, 132.3, 147.0, 148.2, 159.1 ppm.

ST-198 : ^1H NMR (400 MHz, DMSO- d_6): δ 3.64 (s, 3H, -OCH₃), 3.74 (s, 3H, -OCH₃), 3.79 (s, 6H, -OCH₃), 6.85 (s, 2H, -ArH), 6.91 (d, J = 8.8 Hz, 2H, ArH), 6.97 (d, J = 16.4 Hz, 1H, ArH), 7.11 (d, J = 16.4 Hz, 1H, ArH), 7.11 (d, J = 8.8 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.56, 56.29, 60.50, 103.99, 114.64, 126.73, 127.87, 128.03, 130.20, 133.56, 137.42, 153.48, 159.29 ppm.

ST-194 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.67 (s, 3H, $-\text{OCH}_3$), 3.83 (s, 6H, $-\text{OCH}_3$), 6.93 (s, 2H, $-\text{ArH}$), 6.93 (s, 2H, $-\text{ArH}$), 7.21 (s, 2H, $-\text{ArH}$), 7.43 (d, $J=8.4$ Hz, 2H, ArH), 7.60 (d, $J=8.4$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 56.3, 60.5, 104.4, 126.8, 128.3, 129.1, 129.9, 132.1, 132.9, 136.5, 137.9, 153.5 ppm.

ST-190 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.84 (s, 3H, $-\text{OCH}_3$), 6.05 (s, 2H, $-\text{CH}_2$), 6.94 (d, $J=8$ Hz, 1H, ArH), 7.08 (d, $J=16.4$ Hz, 1H, ArH), 7.36 (d, $J=16.8$ Hz, 2H, ArH), 7.68 (d, $J=8.8$ Hz, 2H, ArH), 7.94 (d, $J=8.4$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 52.4, 101.6, 105.9, 108.8, 122.8, 125.8, 126.7, 128.2, 130.0, 131.5, 142.5, 147.9, 148.3, 166.4 ppm.

ST-195 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 1.33 (t, $J=14.0$ Hz, 3H, $-\text{CH}_3$), 3.66 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 6H, $-\text{OCH}_3$), 4.04 (dd, $J=20.8$ Hz, $J=6.8$ Hz, 2H, $-\text{CH}_2$), 6.88 (s, 2H, $-\text{ArH}$), 6.93 (d, $J=8.8$ Hz, 2H, ArH), 7.03 (d, $J=16.4$ Hz, 1H, ArH), 7.17 (d, $J=16.4$ Hz, 1H, ArH), 7.51 (d, $J=8.4$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 15.0, 56.2, 60.4, 63.4, 103.9, 115.0, 126.6, 127.8, 128.0, 130.0, 133.5, 137.3, 153.4, 158.5 ppm.

ST-200 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 2.41 (s, 3H, $-\text{CH}_3$), 3.68 (s, 3H, $-\text{OCH}_3$), 3.84 (s, 6H, $-\text{OCH}_3$), 6.94 (s, 2H, $-\text{ArH}$), 7.05 (d, $J=16$ Hz, 1H, ArH), 7.19-7.16 (m, 3H, ArH), 7.37 (d, $J=16.4$ Hz, 1H, ArH), 7.63 (d, $J=9.6$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 20.0, 56.3, 60.5, 104.5, 125.5, 125.9, 126.5, 127.7, 130.4, 130.7, 133.4, 135.8, 136.4, 137.8, 153.5 ppm.

ST-197: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.67 (s, 3H, $-\text{OCH}_3$), 3.83 (s, 6H, $-\text{OCH}_3$), 6.92 (s, 2H, $-\text{ArH}$), 7.11-7.25 (m, 4H, ArH), 7.19-7.16 (m, 3H, ArH), 7.62 (dd, $J=14.8$

Hz, $J = 6.0$ Hz, 2H, -CH₂) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.3, 60.5, 104.3, 115.9, 116.1, 127.0, 128.5, 128.6, 128.9, 128.9, 133.1, 134.2, 134.2, 137.7, 153.4, 160.7, 163.2 ppm.

ST-203 : ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.78 (s, 6H, -OCH₃), 3.85 (s, 3H, -OCH₃), 6.46 (s, 1H, -ArH), 6.83 (s, 2H, ArH), 7.35 (s, 2H, ArH), 7.73 (d, $J = 8$ Hz, 2H, ArH), 7.96 (d, $J = 8$ Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 52.4, 55.6, 100.9, 105.3, 127.1, 128.2, 128.7, 130.0, 131.7, 139.0, 142.2, 161.1, 166.4 ppm.

ST-209 : ¹H NMR (400 MHz, DMSO-*d*₆): δ 1.33 (t, $J = 11.2$ Hz, 3H, -CH₃), 3.75 (s, 3H, -OCH₃), 3.81 (s, 3H, -OCH₃), 4.03 (d, $J = 6.4$ Hz, 2H, -CH₂), 6.90-6.92 (m, 3H, -ArH), 7.02-7.05 (m, 3H, -ArH), 7.20 (s, 1H, -ArH), 7.49 (d, $J = 8.0$ Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 15.1, 55.9, 63.4, 109.4, 112.2, 115.0, 119.9, 126.4, 126.5, 127.8, 130.3, 130.8, 148.8, 149.3, 158.3 ppm.

ST-210: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.78 (s, 3H, -OCH₃), 3.83 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 6.98 (d, $J = 8.4$ Hz, 1H, ArH), 7.16 (d, $J = 9.6$ Hz, 1H, ArH), 7.24 (d, $J = 16.4$ Hz, 1H, ArH), 7.29 (d, $J = 1.6$ Hz, 1H, ArH), 7.37 (d, $J = 16.4$ Hz, 1H, ArH), 7.71 (d, $J = 8.4$ Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 52.4, 55.9, 109.8, 112.1, 1210.0, 125.4, 126.6, 128.1, 1293.9, 130.0, 131.8, 142.7, 149.4, 149.7, 166.4 ppm.

ST-212 : ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.76 (s, 3H, -OCH₃), 3.76 (s, 3H, -OCH₃), 3.81 (s, 3H, -OCH₃), 6.94-6.91 (m, 3H, ArH), 7.10-6.98 (m, 3H, ArH), 7.20 (s, 1H, -ArH), 7.51 (d, $J = 8.4$ Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.5, 55.9, 55.9, 109.4, 112.2, 114.5, 119.9, 126.3, 126.5, 127.8, 130.4, 130.7, 148.8, 149.3, 159.0 ppm.

ST-211: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.76 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 3H, $-\text{OCH}_3$), 6.95 (d, $J = 8.4$ Hz, 1H, ArH), 7.07-7.23 (m, 6H, ArH), 7.59 (t, $J = 14$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.9, 55.9, 109.6, 112.1, 115.8, 116.0, 120.3, 125.5, 128.3, 128.3, 128.8, 130.3, 134.4, 149.1, 149.3 ppm.

ST-213 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 2.32 (s, 3H, $-\text{CH}_3$), 3.76 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 3H, $-\text{OCH}_3$), 6.95 (d, $J = 8.4$ Hz, 1H, ArH), 7.04-7.26 (m, 6H, ArH), 7.35 (d, $J = 8$ Hz, 1H, ArH), 7.39 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 21.4, 55.9, 55.9, 109.6, 112.2, 120.2, 123.8, 126.7, 127.0, 128.3, 128.6, 128.9, 130.4, 137.7, 138.1, 149.1, 149.3 ppm.

ST-214 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 2.33 (s, 3H, $-\text{CH}_3$), 3.77 (s, 3H, $-\text{OCH}_3$), 3.81 (s, 3H, $-\text{OCH}_3$), 6.94 (d, $J = 8$ Hz, 1H, ArH), 7.02-7.25 (m, 6H, ArH), 7.34 (d, $J = 8$ Hz, 1H, ArH), 7.41 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 20.9, 55.7, 55.9, 101.3, 116.2, 124.2, 125.8, 126.5, 127.6, 128.5, 128.7, 129.9, 132.8, 134.3, 136.1, 149.7, 151.4 ppm.

ST-220: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 1.35 (t, $J = 11.2$ Hz, 3H, $-\text{CH}_3$), 3.74 (s, 3H, $-\text{OCH}_3$), 3.80 (s, 3H, $-\text{OCH}_3$), 4.02 (d, $J = 6.4$ Hz, 2H, $-\text{CH}_2$), 6.90-6.92 (m, 3H, $-\text{ArH}$), 7.02-7.04 (m, 3H, $-\text{ArH}$), 7.21 (s, 1H, $-\text{ArH}$), 7.48 (d, $J = 8.0$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 15.3, 55.8, 63.4, 109.4, 112.2, 115.0, 119.9, 126.4, 126.5, 127.8, 130.3, 130.8, 148.9, 149.1, 158.5 ppm.

ST-121 : ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.67 (s, 3H, $-\text{OCH}_3$), 3.85 (s, 3H, $-\text{OCH}_3$), 3.87 (s, 3H, $-\text{OCH}_3$), 6.97 (s, 2H, $-\text{ArH}$), 7.36 (d, $J = 7.2$ Hz, 2H, ArH), 7.71 (d, $J = 8.0$ Hz, 2H, ArH), 7.98 (d, $J = 8.4$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 51.1,

54.3, 57.5, 60.1, 101.1, 123.8, 127.0, 128.4, 131.1, 131.8, 137.1, 142.8, 150.1, 161.6 ppm.

ST-226: ^1H NMR (400 MHz, DMSO- d_6): δ 3.77 (s, 6H, -OCH₃), 6.46 (d, J =6.4 Hz, 2H, -CH₂), 6.83 (s, 1H, ArH), 7.23-7.37 (m, 5H, -ArH), 7.73-7.86 (m, 6H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.6, 100.9, 105.3, 127.1, 128.2, 128.5, 128.7, 130.0, 131.7, 139.0, 142.2, 152.1 ppm.

ST-227 : ^1H NMR (400 MHz, DMSO- d_6): δ 1.33 (t, J =12.4 Hz, 3H, -CH₃), 4.04 (dd, J =20.8 Hz, J =6.8 Hz, 2H, -CH₂), 6.88 (d, J =6.8 Hz, 2H, -CH₂), 6.93 (d, J =8.8 Hz, 2H, ArH), 7.25-7.38 (m, 6H, -ArH), 7.71-7.77 (m, 4H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 15.3, 56.2, 103.9, 115.0, 126.6, 126.8, 127.8, 128.0, 130.0, 131.1, 132.5, 133.5, 137.3, 153.4, 154.5 ppm.

ST-228: ^1H NMR (400 MHz, DMSO- d_6): δ 3.67 (s, 3H, -OCH₃), 6.97 (s, 2H, -ArH), 7.36 (d, J =7.2 Hz, 2H, ArH), 7.71 (d, J =8.0 Hz, 2H, ArH), 7.98 (d, J =8.4 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 51.1, 101.1, 111.2, 115.4, 120.6, 123.8, 127.0, 127.4, 127.8, 128.4, 131.1, 137.1, 142.8, 150.1, 161.6 ppm.

ST-230: ^1H NMR (400 MHz, DMSO- d_6): δ 3.73 (s, 3H, -OCH₃), 6.97 (d, J =7.2 Hz, 2H, ArH), 7.36 (d, J =7.2 Hz, 2H, ArH), 7.46-7.53 (m, 11H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.8, 111.5, 125.3, 125.6, 126.7, 129.5, 130.2, 131.4, 140.5, 142.3, 158.3 ppm.

ST-237 : ^1H NMR (400 MHz, DMSO- d_6): δ 1.34 (t, J =13.6 Hz, 3H, -CH₃), 4.06 (dd, J =20.8 Hz, J =6.8 Hz, 2H, -CH₂), 6.96 (d, J =8.4 Hz, 2H, ArH), 7.23-7.37 (m, 2H, -ArH), 7.46-7.50 (m, 2H, -ArH), 7.58 (d, J =8.4 Hz, 2H, ArH), 7.82-7.90 (m, 3H, -ArH), 6.37 (s,

1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 15.1, 63.5, 115.1, 123.9, 126.1, 126.4, 126.8, 128.0, 128.1, 128.3, 128.5, 129.1, 129.9, 132.7, 133.7, 135.4, 158.7 ppm.

ST-233 : ^1H NMR (400 MHz, DMSO- d_6): δ 3.67 (s, 3H, -OCH₃), 3.78 (s, 6H, -OCH₃), 3.83 (s, 6H, -OCH₃), 6.40 (s, 1H, -ArH), 6.77 (d, J =2 Hz, 2H, ArH), 6.92 (s, 2H, ArH), 7.13-7.24 (m, 2H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.6, 56.2, 60.5, 100.3, 104.3, 104.6, 128.2, 129.5, 133.0, 137.7, 139.6, 153.4, 161.0 ppm.

ST-234: ^1H NMR (400 MHz, DMSO- d_6): δ 3.73 (s, 12H, -OCH₃), 6.43 (s, 2H, -ArH), 6.77 (d, J =8 Hz, 2H, ArH), 6.92 (s, 4H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.6, 99.6, 105.2, 127.4, 140.2, 158.4 ppm.

ST-238: ^1H NMR (400 MHz, DMSO- d_6): δ 3.73 (s, 3H, -OCH₃), 7.18-7.30 (m, 3H, ArH), 7.45-7.55 (m, 3H, ArH), 7.75 (d, J =7.6 Hz, 1H, ArH), 7.87-7.90 (m, 3H, ArH), 8.01 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.6, 121.5, 124.7, 125.4, 126.7, 126.8, 127.4, 128.0, 128.3, 128.6, 130.2, 130.8, 132.1, 133.7, 135.3, 136.5, 140.1 ppm.

ST-239 : ^1H NMR (400 MHz, DMSO- d_6): δ 3.75 (s, 3H, -OCH₃), 6.81 (d, J =8.4 Hz, 2H, ArH), 7.25-7.36 (m, 2H, -ArH), 7.45-7.59 (m, 2H, -ArH), 7.61 (d, J =8.0 Hz, 2H, ArH), 7.80-7.97 (m, 4H, -ArH), 6.37 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.5, 110.4, 122.4, 125.2, 125.4, 126.1, 128.2, 128.3, 128.3, 128.8, 129.1, 129.5, 132.8, 132.9, 133.2, 152.3 ppm.

ST-240: ^1H NMR (400 MHz, DMSO- d_6): δ 2.43 (s, 3H, -CH₃), 7.08-7.26 (m, 3H, ArH), 7.45-7.52 (m, 3H, ArH), 7.71 (d, J =8 Hz, 1H, ArH), 7.84-7.99 (m, 4H, ArH) ppm. ^{13}C

NMR (100 MHz, DMSO-*d*₆): 19.7, 119.5, 121.5, 124.1, 125.7, 126.8, 126.9, 128.0, 128.3, 128.6, 131.1, 132.9, 133.4, 133.9, 134.3, 134.4, 135.3 ppm.

ST-241: ¹H NMR (400 MHz, DMSO-*d*₆): δ 2.45 (s, 3H, -CH₃), 7.19-7.31 (m, 3H, ArH), 7.48-7.59 (m, 3H, ArH), 7.73 (d, *J* = 7.6 Hz, 1H, ArH), 7.89-7.92 (m, 3H, ArH), 8.03 (s, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 20.03, 124.25, 125.5, 126.4, 126.6, 126.8, 126.9, 128.0, 128.3, 128.6, 130.1, 130.8, 133.0, 133.7, 135.3, 136.0, 136.2 ppm.

ST-242: ¹H NMR (400 MHz, DMSO-*d*₆): δ 6.82 (d, *J* = 8.0 Hz, 2H, ArH), 7.22-7.35 (m, 2H, -ArH), 7.46-7.61 (m, 2H, -ArH), 7.72 (d, *J* = 8.4 Hz, 2H, ArH), 7.82-7.999 (m, 4H, -ArH), 6.65 (s, 1H, -ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 113.5, 122.4, 125.2, 125.4, 125.5, 127.2, 128.2, 128.3, 128.8, 129.1, 129.5, 132.8, 133.7, 135.4, 159.5 ppm.

ST-243: ¹H NMR (400 MHz, DMSO-*d*₆): δ 7.19-7.31 (m, 3H, ArH), 7.48-7.59 (m, 3H, ArH), 7.73 (d, *J* = 7.6 Hz, 1H, ArH), 7.89-7.92 (m, 3H, ArH), 8.03 (s, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 111.7, 125.5, 126.4, 126.6, 126.8, 126.9, 128.0, 128.3, 128.6, 130.1, 131.8, 133.1, 133.5, 134.3, 135.0, 154.2 ppm.

ST-245: ¹H NMR (400 MHz, DMSO-*d*₆): δ 1.34 (t, *J* = 11.2 Hz, 3H, -CH₃), 3.99 (s, 3H, -OCH₃), 4.05 (dd, *J* = 20.4 Hz, *J* = 6.8 Hz, 2H, -CH₂), 6.95 (d, *J* = 8.4 Hz, 2H, ArH), 7.02 (d, *J* = 7.6 Hz, 1H, ArH), 7.11 (d, *J* = 16 Hz, 1H, ArH), 7.51-7.65 (m, 4H, -ArH), 7.75-7.82 (m, 2H, -ArH), 8.21 (d, *J* = 8.0 Hz, 1H, ArH), 8.35 (d, *J* = 8.4 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 15.3, 55.8, 63.4, 109.4, 112.2, 115.0, 119.9, 126.4, 126.5, 127.8, 130.3, 130.8, 148.9, 149.1, 158.5 ppm.

ST-246: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.64 (s, 3H, -OCH₃), 3.75 (s, 3H, -OCH₃), 6.37 (s, 1H, -ArH), 6.74 (d, *J* = 1.6 Hz, 2H, ArH), 6.89 (s, 1H, ArH), 7.16 (dd, *J* = 42 Hz, *J*

=16.4 Hz, 2H, -CH₂) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.6, 56.2, 60.5, 100.3, 104.3, 104.6, 128.2, 129.5, 133.0, 137.7, 139.6, 153.4, 161.0 ppm.

ST-247: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.65 (s, 3H, -OCH₃), 3.67 (s, 3H, -OCH₃), 6.75 (d, *J* =8.0 Hz, 2H, ArH), 7.12 (d, *J* =8.4 Hz, 1H, ArH), 7.11 (d, *J* =8.4 Hz, 1H, ArH), 7.51-7.65 (m, 4H, -ArH), 7.75-7.82 (m, 2H, -ArH), 8.19 (d, *J* =8.4 Hz, 1H, ArH), 8.24 (d, *J* =8.0 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.8, 55.9, 104.6, 112.2, 116.1, 120.4, 126.4, 126.5, 127.8, 130.3, 131.4, 144.1, 145.5, 158.5 ppm.

ST-268: ¹H NMR (400 MHz, DMSO-*d*₆): δ 1.35 (t, *J* =12.4 Hz, 3H, -CH₃), 4.01 (dd, *J* =16.4 Hz, *J* =8.0 Hz, 2H, -CH₂), 4.15 (s, 4H, -CH₂), 6.85 (d, *J* =8.8 Hz, 1H, ArH), 7.06-7.13 (m, 4H, ArH), 7.15 (t, *J* =17.6 Hz, 2H, ArH), 7.56-7.60 (m, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 15.1, 59.1, 64.4, 64.6, 115.1, 115.8, 116.0, 117.6, 120.2, 125.9, 128.2, 128.3, 128.4, 128.5, 131.9, 134.3, 145.1, 149.1 ppm.

ST-269 : ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.85 (s, 3H, -OCH₃), 4.26(s, 4H, -CH₂), 6.88 (d, *J* =8.4 Hz, 1H, ArH), 7.10-7.18 (m, 3H, ArH), 7.32 (d, *J* =16.4 Hz, 1H, ArH), 7.69 (d, *J* =8.4 Hz, 2H, ArH), 7.93 (d, *J* =8.4 Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 52.4, 64.4, 64.6, 115.5, 117.7, 120.7, 125.8, 126.7, 128.2, 130.0, 130.5, 131.3, 142.5, 143.9, 144.2, 166.4 ppm.

ST-270: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.76 (s, 3H, -OCH₃), 4.24 (s, 4H, -CH₂), 6.83 (d, *J* =8 Hz, 1H, ArH), 6.93 (d, *J* =8.4 Hz, 2H, ArH), 6.97-7.07 (m, 4H, ArH), 7.49 (d, *J* =8.8 Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.5, 64.4, 64.5, 114.5, 114.8, 117.6, 119.9, 126.0, 126.7, 127.9, 130.3, 131.4, 143.2, 143.9, 159.1 ppm.

ST-273: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 4.25 (s, 4H, $-\text{CH}_2$), 6.85 (d, $J=8.8$ Hz, 1H, ArH), 7.07-7.11 (m, 4H, ArH), 7.18 (t, $J=17.6$ Hz, 2H, ArH), 7.57-7.61 (m, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 64.4, 64.6, 115.1, 115.8, 116.0, 117.6, 120.2, 125.9, 128.2, 128.3, 128.4, 128.5, 130.9, 134.3, 143.6, 143.9 ppm.

ST-274: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 4.25 (s, 4H, $-\text{CH}_2$), 6.84 (d, $J=8.4$ Hz, 1H, ArH), 7.05-7.17 (m, 4H, ArH), 7.40 (d, $J=8.4$ Hz, 2H, ArH), 7.57 (d, $J=8.8$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 64.4, 64.6, 115.2, 117.6, 120.4, 125.7, 128.2, 129.0, 129.2, 130.8, 131.8, 136.9, 136.6, 143.8, 143.9 ppm.

ST-275: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 4.19 (s, 4H, $-\text{CH}_2$), 6.79 (d, $J=8.8$ Hz, 1H, ArH), 7.10-7.15 (m, 4H, ArH), 7.21 (t, $J=17.6$ Hz, 2H, ArH), 7.59-7.63 (m, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 64.7, 64.7, 113.2, 115.8, 116.1, 119.8, 123.7, 123.9, 128.5, 129.1, 129.4, 129.5, 131.5, 136.3, 144.4, 146.5 ppm.

ST-295: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 1.32 (t, $J=12.8$ Hz, 3H, $-\text{CH}_3$), 4.04 (d, $J=6.4$ Hz, 2H, $-\text{CH}_2$), 6.94 (d, $J=8.4$ Hz, 2H, ArH), 7.07 (d, $J=16.4$ Hz, 1H, ArH), 7.32 (d, $J=16.4$ Hz, 1H, ArH), 7.50-7.59 (m, 4H, ArH), 7.82 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 15.1, 63.5, 115.0, 123.8, 126.5, 128.0, 128.5, 129.4, 130.9, 131.1, 131.8, 138.9, 159.1 ppm.

ST-297: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.68 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 6H, $-\text{OCH}_3$), 6.93 (s, 2H, ArH), 7.23 (d, $J=16.4$ Hz, 1H, ArH), 7.33 (d, $J=16.4$ Hz, 1H, ArH), 7.56 (d, $J=8.4$ Hz, 1H, ArH), 7.63 (d, $J=8.4$ Hz, 1H, ArH), 7.85 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 56.3, 60.5, 104.6, 125.6, 126.7, 128.2, 129.7, 131.2, 131.4, 131.9, 132.6, 138.1, 138.6, 153.4 ppm.

ST-294: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.77 (s, 3H, $-\text{OCH}_3$), 6.96 (d, $J=8.4$ Hz, 2H, ArH), 7.08 (d, $J=16.4$ Hz, 1H, ArH), 7.32 (d, $J=16.4$ Hz, 1H, ArH), 7.52-7.58 (m, 4H, ArH), 7.81 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.5, 114.6, 123.9, 126.5, 128.0, 128.5, 129.4, 129.5, 130.8, 131.1, 131.8, 138.8, 159.8 ppm.

ST-298: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 2.33 (s, 3H, $-\text{CH}_3$), 7.12 (d, $J=7.2$ Hz, 1H, ArH), 7.24-7.42 (m, 4H, ArH), 7.61 (dd, $J=8.4$ Hz, $J=15.2$ Hz, 2H, ArH), 7.88 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 21.4, 124.5, 126.1, 126.9, 127.6, 128.4, 129.1, 129.3, 131.2, 131.3, 136.8, 138.2, 138.5 ppm.

ST-290: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 7.22 (s, 1H, ArH), 7.91-7.93 (m, 3H, ArH), 7.88 (s, 1H, ArH), 8.30-8.34 (m, 3H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 106.7, 108.0, 117.9, 121.9, 124.8, 126.7, 137.5, 140.2, 146.1, 147.4, 149.6 ppm.

ST-283: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 2.33 (s, 6H, ArH), 7.46 (d, $J=6.8$ Hz, 2H, ArH), 7.24-7.28 (m, 6H, ArH), 7.38-7.44 (m, 4H, ArH), 7.60 (s, 4H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 19.8, 121.5, 123.5, 124.1, 125.5, 126.4, 127.4, 127.6, 128.2, 128.8, 135.2 ppm.

ST-284: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 2.42 (s, 6H, ArH), 7.12-7.21 (m, 8H, ArH), 7.46 (d, $J=16.4$ Hz, 2H, ArH), 7.64-7.69 (m, 6H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 19.2, 124.2, 124.8, 124.9, 125.5, 126.4, 127.4, 127.4, 128.6, 129.5, 136.7 ppm.

NI-ST-11: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.67 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 6H, $-\text{OCH}_3$), 6.93 (s, 2H, $-\text{ArH}$), 7.32 (s, 2H, $-\text{ArH}$), 8.41 (s, 2H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz,

DMSO-*d*₆): 56.7, 56.8, 61.0, 104.9, 124.8, 127.5, 129.1, 131.5, 133.2, 138.5, 141.4, 146.0, 154.0 ppm.

NI-ST-12: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.67 (s, 3H, -OCH₃), 3.82 (s, 6H, -OCH₃), 3.94 (s, 3H, -OCH₃), 6.92 (s, 2H, -ArH), 7.24 (s, 2H, -ArH), 7.34 (d, *J* = 8.0 Hz, 1H, ArH), 7.85 (d, *J* = 8.0 Hz, 1H, ArH), 8.09 (s, 1H, -ArH), 8.52 (s, 2H, -ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.6, 60.2, 103.6, 112.4, 114.6, 124.6, 127.4, 127.5, 130.5, 131.2, 134.5, 140.4, 145.4, 149.5, 152.3 ppm.

DNR-1; ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.76 (s, 6H, -OCH₃), 6.33 (s, 1H, -ArH), 6.71 (s, 2H, -ArH), 6.83 (d, 1H, -ArH, *J* = 16.4 Hz), 7.12 (d, 1H, -ArH *J* = 16 Hz), 8.10 (s, 2H, -ArH) ppm. ¹³C NMR (DMSO-*d*₆, ppm): δ 55.5, 99.6, 104.2, 110.0, 113.5, 124.2, 128.1, 128.5, 140.7, 143.6, 159.7, 161.0 ppm.

ST-208 : ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.77 (s, 3H, -OCH₃), 3.81 (s, 3H, -OCH₃), 6.94 (d, 1H, -ArH *J* = 8 Hz), 7.09 (d, 1H, -ArH *J* = 9.6 Hz), 7.15 (s, 1H, -ArH), 7.19 (s, 1H, -ArH), 7.24 (d, *J* = 1.6 Hz, 1H, ArH), 7.41 (d, 2H, -ArH *J* = 8 Hz), 7.59 (d, 2H, -ArH *J* = 8.4 Hz) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.9, 109.6, 112.1, 120.6, 125.3, 128.1, 129.1, 129.7, 130.1, 131.8, 136.8, 149.3 ppm.

2.3 Synthesis of (*E*)-3,5,4'-trimethoxy resveratrol analogues with substitutions at the C2 position on the stilbene.

2.3.1 Prior studies with this scaffold

Structure-activity relationship studies on the resveratrol molecule identified *trans*-3,5,4'-trimethoxy-resveratrol as a lead drug candidate and further SAR studies revealed that

various substitutions at the C2 position on *trans*-3,5,4'-trimethoxy-resveratrol led to enhanced cytotoxic activity against a variety of tumor cell lines (**Figure 2.3**).

Figure 2.3 Structures of *trans*-3,5,4'-trimethoxystilbene and its potent analogs.

In 2006, Huang *et al.* reported that *O*-methylation of resveratrol caused an increase in cytotoxicity and that introduction of a formyl group (**B**) or an alkyl amine moiety (**C**) at the C2 position on the *trans*-3,5,4'-trimethoxystilbene scaffold (**A**) led to an enhanced cytotoxic activity (Huang, Ruan *et al.* 2007). In related studies, Ruan *et al.* have reported the antitumor activity of resveratrol derivatives possessing a chalcone moiety (**Figure 2.3**, Structure **D**); these analogues exhibited potent anti-proliferative and antitubulin

activities, and compound **D** inhibited the growth of cancer cell lines HepG2, B16-F10, and A549 with IC₅₀ values of 0.2, 0.1, and 1.4 µg/mL, respectively.(Ruan, Lu et al. 2011). Recently, Raun and co-workers reported compounds **E** and **F** to be the most potent among the *trans*-3,5,4'-trimethoxystilbene acrylamides amine derivatives. Compounds **E** had the best cytotoxicity against the HuH-7 cell line and its IC₅₀ was 4.5 µmol/L; and compound **F** had the best anti-tumor activity against the K562 cell line with an IC₅₀ of 2.9 µmol/L.

2.3.2 Chemistry and analytical data

Based on the structure-activity relationship analysis of the above mentioned literature, it is evident that substitutions at the C2 position of the *trans*-3,5,4'-trimethoxystilbene scaffold (**Figure 2.3, A**) leads to enhanced cytotoxic activity along with increased tubulin binding capacity. In this respect, we have synthesized a range of *trans*-3,5,4'-trimethoxy resveratrol analogs with substitutions at the C2 position. We designed and synthesized a series of novel *trans*-3,5,4'-trimethoxy resveratrol analogs incorporating an α,β -unsaturated double bond conjugated to different five, and six membered heterocyclic and bicyclic quinuclidinone ring systems **Scheme 2.2** and **Scheme 2.3**. Also, we synthesized a series of 3,5,4'-trimethoxy resveratrol analogs with acrylonitrile substitutions at the C2 position **Scheme 2.3**.

Scheme 2.2 Synthesis of resveratrol analogs with heterocyclic ring substitutions at the C2 position. (a) MeI, K₂CO₃, acetone; (a') POCl₃, DMF, 0 °C, 69% yield; (b) barbituric acid or thiobarbituric acid, methanol, RT, 6 hrs, 95-96% yield; (c) five membered active methylene compound, NH₄OAc, AcOH, MWI, 1-2 min, 94-97% yield; (d) isobarbituric acid, ethanol, reflux, 4 hrs, 60% yield.

The procedure for synthesizing compound **RES-11** involves *O*-methylating the hydroxyl groups on resveratrol with MeI/ K₂CO₃ in acetone followed by formylation of (*E*)-1,3-dimethoxy-5-(4-methoxystyryl) benzene in the presence of a slight excess of POCl₃ in DMF at 0 °C for 30 min yielding *trans*-2-formyl-3,4,5-trimethoxy stilbene (**RES-11**).

(RES-11): ¹H NMR (DMSO-*d*₆): 3.78 (s, 3H), 3.90 (s, 3H), 3.92 (s, 3H), 6.63 (s, 1H), 6.91 (s, 1H), 6.97 (d, 2H, *J* = 7.9 Hz), 7.21 (d, 1H, *J* = 16.2 Hz), 7.50 (d, 2H, *J* = 7.9 Hz),

7.95 (d, 1H, $J = 16.2$ Hz), 10.41 (s, 1H) ppm. ^{13}C -NMR (DMSO- d_6): 55.8, 56.1, 101.2, 102.5, 109.8, 114.3, 129.4, 130.5, 131.4, 139.7, 162.5, 167.8, 193.5 ppm.

The novel resveratrol analogs (**RES-09** to **RES-27**) were then prepared by aldol condensation of **RES-11** with an appropriate active methylene compound, utilizing a variety of reaction conditions, i.e., ammonium acetate in acetic acid under microwave irradiation (MWI) conditions, by refluxing the reactants in ethanol, or by stirring the reaction at ambient temperature in methanol. The synthetic routes to the resveratrol analogs **RES-09** to **RES-27** are illustrated in **Scheme 2.2**.

RES-09: ^1H NMR (DMSO- d_6): δ 3.72-3.86 (m, 9H, 3 -OCH₃), 6.38 (d, 1H, $J=24$ Hz, C6H), 6.79 (d, 1H, C4H), 6.81-6.96 (m, 3H, C8H, C11H, C13H), 7.11 (s, 1H, C7H, C15H), 7.43-7.48 (m, 3H) ppm. ^{13}C -NMR (DMSO- d_6): δ 55.3, 55.5, 55.8, 55.8, 56.1, 97.3, 97.7, 102.2, 111.4, 113.8, 124.6, 127.6, 127.5, 129.1, 129.7, 129.9, 131.8, 132.4, 139.5, 159.0, 159.8, 162.6, 167.3, 169.8 ppm; mp: 146-148 °C.

RES-10: ^1H NMR (DMSO- d_6): δ 3.78 (d, 6H, -OCH₃), 3.84 (s, 3H, -OCH₃), 6.25(s, 1H, C6H), 6.73 (s, 1H, - Ar), 6.78 (d, 1H, $J=1.8$ Hz, C4H), 6.89 (d, 2H, C7H ,C8H, $J=8.7$ Hz), 6.95 (d, 2H, C11H,C13H, $J=4.5$ Hz), 7.35 (d, 2H, $J=8.7$) ppm. ^{13}C -NMR (DMSO- d_6): δ 56.4, 55.7, 55.9,100.6, 101.7, 109.4, 114.5, 123.4, 129.7, 130.2, 131.4, 136.7, 148.4, 158.7, 158.9,160.4, 166.5, 166.9, 175.4 ppm; mp: 187-189°C.

RES-80: ^1H NMR (DMSO- d_6): δ 2.74 (s, 3H, -CH₃), 3.20 (s, 3H, -CH₃), 3.64 (s, 3H, -OCH₃), 3.76 (s, 3H, -OCH₃), 3.78 (s, 3H, -OCH₃), 4.00 (s, 1H, ArH), 4.59 (s, 1H, -ArH), 6.32 (s, 1H, -ArH), 6.58 (s, 1H, ArH), 6.98 (s, 1H, ArH), 7.04 (d, 2H, $J=8.4$, ArH), 7.50 (d, 2H, $J=8.4$, ArH) ppm. ^{13}C -NMR (DMSO- d_6): δ 27.91, 28.5, 48.5, 55.7, 55.7,

55.8, 95.5, 99.4, 114.9, 127.0, 128.4, 147.1, 149.9, 151.9, 155.3, 159.5, 161.4. ppm; mp: 156-158°C.

RES-14: ^1H NMR (DMSO- d_6): δ 3.57 (d, 6H, -OCH₃), 3.61 (s, 3H, -OCH₃), 6.35 (d, 1H, $J=24$ Hz, C6H), 6.75 (d, 1H, C4H), 6.82-6.94 (m, 3H, C8H, C11H, C13H), 7.17 (s, 2H, C7H, C15H), 7.39-7.48 (m, 2H) ppm. ^{13}C -NMR (DMSO- d_6): δ 55.6, 55.8, 56.2, 100.5, 102.3, 109.4, 114.3, 122.4, 124.5, 127.5, 130.4, 136.7, 154.3, 158.6, 159.1, 161.3, 163.6.ppm; mp: 123-125 °C.

RES-27: molecular formula: C₂₂H₂₃N_{ST-624}; ^1H NMR (DMSO- d_6): δ 2.84 (s, 3H, -NCH₃), 3.81 (d, 6H, -OCH₃), 3.89 (s, 3H, -OCH₃), 6.39(s, 1H, C6H), 6.75 (s, 1H, =CH), 6.79 (d, 1H, $J=1.8$ Hz, C4H), 6.85 (d, 2H, C7H ,C8H, $J=8.7$ Hz), 6.99 (d, 2H, C11H,C13H, $J=4.5$ Hz), 7.38 (d, 2H, C10H,C14H, $J=8.7$) ppm. ^{13}C -NMR (DMSO- d_6): δ 29.9, 55.6, 55.7, 55.8, 97.5, 100.9, 106.3, 113.7,114.3, 114.4, 124.2, 128.1, 128.5, 129.8, 130.7, 135.3, 138.9, 158.8, 159.7, 160.8, 167.9, 176.2 ppm; mp: 162-165°C.

RES-13: ^1H NMR (DMSO- d_6): δ 3.81-3.93 (m, 9H, 3 x -OCH₃),6.51 (s, 1H, C6H), 6.93-6.98 (m, 4H, C4H, C8H, C11H, C13H), 6.27 (d, 1H, C7H),7.45 (d, 2H, $J=12.0$ Hz, C10H, C14H), 8.34 (d, 1H, $J=2$ Hz, C15H), 11.21 (s, 1H, NH) ppm. ^{13}C NMR (DMSO- d_6): δ 55.6, 55.9, 56.1, 101.4, 114.3, 120.4, 126.4, 129.8, 131.4, 131.6, 137.5, 139.6, 157.5, 159.4, 161.3, 165.6, 175.9. ppm; mp: 112-114 °C.

RES-16: ^1H NMR (DMSO- d_6): δ 3.77 (s, 3H, -OCH₃), 3.91 (s, 3H, -OCH₃), 3.93 (s, 3H, -OCH₃),6.54 (s, 1H, C6H), 6.61 (d, 1H, C7H), 6.81-6.87 (m, 4H, C4H, C8H, C11H, C13H), 7.24 (d, 2H, $J=12.0$ Hz, C10H, C14H), 8.22 (d, 1H, $J=2$ Hz, C15H)

ppm. ^{13}C NMR (DMSO- d_6): δ 54.6, 55.1, 100.4, 102.4, 112.4, 116.0, 127.9, 130.4, 131.3, 136.7, 154.3, 160.7, 161.3, 167.6. ppm; mp: 143-144 °C.

RES-23: Molecular formula: $\text{C}_{21}\text{H}_{19}\text{NO}_4\text{S}_2$; ^1H NMR (DMSO- d_6): δ 3.70-3.83 (m, 9H, 3 -OCH₃), 6.31 (d, 1H, $J=20.1$ Hz, C6H), 6.78 (d, 1H, C4H), 6.86-6.98 (m, 3H, C8H, C11H, C13H), 7.11 (s, 2H, C7H, C15H), 7.41-7.48 (m, 2H) ppm. ^{13}C -NMR (DMSO- d_6): δ 55.4, 55.5, 55.6, 55.9, 56.0, 97.8, 97.9, 103.2, 113.7, 114.6, 123.7, 126.9, 128.6, 128.7, 129.1, 129.8, 132.6, 139.5, 159.0, 159.8, 162.3, 167.6, 169.0 ppm; mp: 130-135 °C.

RES-18: Molecular formula: $\text{C}_{22}\text{H}_{20}\text{N}_2\text{O}_6$; ^1H NMR (DMSO- d_6): δ 3.81-3.93 (m, 9H, 3 x -OCH₃), 6.57 (s, 1H, C6H), 6.96-6.99 (m, 4H, C4H, C8H, C11H, C13H), 6.15 (d, 1H, C7H), 7.54 (d, 2H, $J=8.5$ Hz, C10H, C14H), 8.32 (d, 1H, $J=2$ Hz, C15H), 11.0 (s, 1H, NH), 11.36 (s, 1H, NH) ppm. ^{13}C NMR (DMSO- d_6): δ 53.3, 55.5, 55.6, 55.9, 55.9, 56.2, 56.3, 97.55, 97.6, 102.1, 102.4, 114.5, 115.6, 121.3, 124.2, 128.6, 129.9, 131.9, 139.7, 149.7, 150.7, 159.4, 159.7, 161.3, 162.4, 163.4 ppm; mp: 141-146 °C.

RES-17: ^1H NMR (DMSO- d_6): δ 3.63 (s, 3H, -OCH₃), 3.82 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 6.55 (s, 1H, C6H), 6.64 (d, 1H, C4H), 6.87-6.96 (m, 3H, C8H, C11H, C13H), 7.12 (d, 1H, C7H), 7.35 (d, 2H, $J=12.0$ Hz, C10H, C14H), 8.34 (d, 1H, $J=2$ Hz, C15H) ppm. ^{13}C NMR (DMSO- d_6): δ 54.6, 54.7, 55.2, 110.4, 115.8, 121.3, 127.7, 128.6, 131.4, 131.8, 138.3, 139.9, 147.5, 156.8, 162.3, 165.6, 169.5 ppm; mp: 157-159 °C.

Scheme 2.3 Synthesis of resveratrol analogs with bicyclic and acrylonitrile substitutions at the C2 position (a) Quinuclidinone, 20% NaOH, EtOH, reflux; (b) $\text{NH}_2\text{OH}\cdot\text{HCl}$, AcONa, EtOH; (c) Phenylacetonitrile, NaOMe, EtOH, 6hrs reflux.

The synthetic procedure for synthesizing compounds **ST-98-ST-139** is shown in **Scheme 2.3**. *Trans*-2-formyl-3,4',5-trimethoxystilbene (**RES-11**) (1 mmol) and an appropriate phenylacetonitrile (1.1 mmol) were dissolved in 10 volumes of EtOH. 50% w/v aq. NaOMe was then added and mixture was refluxed for 6 hrs. The reaction was monitored by TLC (Thin Layer Chromatography). Once the reaction was completed the organic solvent was rota evaporated and purified by flash column chromatography with an EA/hexane solvent system, to afford analogs (**ST-98**)-(ST-139) in yields ranging from 60-90%.

ST-98: ^1H NMR ($\text{DMSO}-d_6$): δ 3.71 (s, 3H, $-\text{OCH}_3$), 3.75 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 3H, $-\text{OCH}_3$), 3.85 (s, 6H, $-\text{OCH}_3$), 3.89 (s, 3H, $-\text{OCH}_3$), 6.61 (s, 1H, ArH), 6.94 (d, $J=8.4$ Hz, 2H), 7.00 (s, 3H, ArH), 7.08 (d, $J=16$ Hz, 2H), 7.28 (d, $J=16$ Hz, 2H), 7.49 (d, $J=8.4$ Hz, 1H), 7.98 (s, 1H, ArH) ppm. ^{13}C -NMR ($\text{DMSO}-d_6$): δ 55.1, 55.3, 55.8, 56.1, 56.4, 98.2,

101.5, 104.7, 108.1, 110.5, 115.4, 117.6, 114.2, 121.4, 127.6, 131.7, 134.2, 159.7, 160.7, 162.8 166.7 ppm.

ST-127: ^1H NMR (DMSO- d_6): δ 3.74 (s, 3H, -OCH₃), 3.81 (s, 6H, -OCH₃), 3.84 (s, 3H, -OCH₃), 3.89 (s, 3H, -OCH₃), 6.60 (s, 1H, ArH), 6.93 (d, $J=8.4$ Hz, 2H), 6.97 (s, 1H, ArH), 7.03-7.07 (m, 2H), 7.28 (m, 2H), 7.33 (s, 1H, ArH), 7.47 (d, $J=8.4$ Hz, 2H), 7.89 (s, 1H, ArH) ppm. ^{13}C -NMR (DMSO- d_6): δ 55.3, 55.4, 56.2, 56.4, 56.8, 56.9, 97.5, 100.8, 104.7, 108.4, 111.5, 111.8, 114.5, 124.7, 129.5, 131.4, 134.8, 138.4, 147.5, 149.6, 158.7, 163.8, 164.5 ppm.

ST-99: ^1H NMR (DMSO- d_6): δ 3.75 (s, 3H, -OCH₃), 3.81 (s, 9H, -OCH₃), 3.89 (s, 3H, -OCH₃), 6.61 (d, $J=7.2$ Hz, 2H), 6.87 (d, $J=1.6$ Hz, 2H), 6.94 (d, $J=8.8$ Hz, 2H), 6.98 (d, $J=1.2$ Hz, 1H), 7.07 (d, 1H, $J=16.0$ Hz, ArH), 7.27 (d, 1H, $J=16.0$ Hz, ArH), 7.49 (d, 1H, $J=8.4$ Hz, ArH), 8.03 (s, 1H, ArH) ppm. ^{13}C -NMR (DMSO- d_6): δ 55.2, 55.8, 55.9, 99.5, 100.5, 101.7, 109.5, 118.6, 120.5, 114.2, 127.4, 131.4, 136.3, 158.5, 160.7, 161.5. ppm.

ST-100: ^1H NMR (DMSO- d_6): δ 3.75 (s, 3H, -OCH₃), 3.81 (s, 6H, -OCH₃), 3.89 (s, 3H, -OCH₃), 6.60 (s, 1H, ArH), 6.91-7.07 (m, 6H, $J= 64.8$ Hz ArH), 7.22 (d, 1H, $J= 16.4$ Hz, ArH), 7.45 (d, 2H, ArH, $J= 8.4$ Hz), 7.68 (d, 2H, ArH and $J= 8$ Hz), 7.83 (s, 1H, ArH). ^{13}C -NMR (DMSO- d_6): δ 55.6, 55.9, 55.9, 56.1, 98.2, 102.2, 114.7, 115.5, 117.2, 117.6, 123.7, 126.1, 128.5, 129.6, 129.7, 129.9, 131.6, 133.8, 138.9, 139.4, 158.9, 159.7, 161.6 ppm.

ST-128: ^1H NMR ($\text{DMSO-}d_6$): δ 3.78 (s, 3H, $-\text{OCH}_3$), 3.86 (s, 3H, $-\text{OCH}_3$), 3.88 (s, 3H, $-\text{OCH}_3$), 6.18 (s, 1H, ArH), 6.75 (d, $J=8.6$ Hz, 2H), 6.83 (s, 2H, ArH), 7.12 (d, 1H, $J=16.0$ Hz, ArH), 7.28 (d, 1H, $J=16.0$ Hz, ArH), 7.43-7.50 (m, 6H, ArH), 7.77 (d, 2H, $J=8.4$ Hz, ArH), 8.01 (s, 1H, ArH). ^{13}C -NMR ($\text{DMSO-}d_6$): δ 55.7, 55.2, 56.4, 99.1, 101.2, 114.7, 117.3, 117.9, 118.9, 124.8, 126.6, 127.6, 128.2, 129.5, 129.8, 131.9, 135.4, 138.5, 140.2, 158.6, 158.8, 162.4 ppm.

ST-139: ^1H NMR ($\text{DMSO-}d_6$): δ 3.74 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 3H, $-\text{OCH}_3$), 3.89 (s, 3H, $-\text{OCH}_3$), 6.13 (s, 1H, ArH), 6.93 (d, $J=8.8$ Hz, 2H), 6.98 (s, 2H, ArH), 7.08 (d, 1H, $J=16.4$ Hz, ArH), 7.22 (d, 1H, $J=16.4$ Hz, ArH), 7.45-7.51 (m, 6H, ArH), 7.76 (d, 2H, $J=7.2$ Hz, ArH), 7.98 (s, 1H, ArH). ^{13}C -NMR ($\text{DMSO-}d_6$): δ 55.5, 55.9, 56.1, 98.2, 102.2, 114.7, 115.5, 117.1, 117.59, 123.6, 126.0, 128.4, 129.5, 129.6, 129.9, 131.9, 133.8, 138.9, 139.4, 158.8, 159.6, 161.6 ppm.

For preparing compound **ST-54**, *E*-2,4-dimethoxy-6-(4-methoxystyryl)benzaldehyde (**RES-11**) and quinuclidinone (1.2 mmol) were added to 10 volumes of methanol and the resulting mixture stirred at room temperature. The final product **ST-54**, crashed out of the solution once the reaction was complete in 1-2 hrs. The final product was filtered and recrystallized from methanol to afford **ST-54** in 80% yield. In the next step, compound **ST-54** (1mmol), hydroxylamine HCl (1.1 mmol) and sodium acetate (1.5 mmol) were dissolved in 10 volumes of ethanol and the mixture was heated under reflux for 6 hrs. A white precipitate was formed, which was later filtered off to afford **ST-57** in 65% yield (**Scheme 2.3**). **ST-54:** ^1H NMR ($\text{DMSO-}d_6$): δ 1.96 (d, $J=3$ Hz, 4H), 2.63 (s, 1H), 2.90–2.92 (m, 4H), 3.72–3.82 (m, 6H), 3.86 (s, 3H), 6.39 (d, $J=3$ Hz, 1H), 6.78 (d, $J=3$ Hz,

1H), 6.86 (d, J=9 Hz, 2H), 6.95 (d, J=6 Hz, 2H), 7.26 (s, 1H), 7.38 (d, J=6 Hz, 2H) ppm.
.¹³C NMR (DMSO-d₆): δ 26.1, 41.0, 48.2, 49.7, 55.6, 55.7, 55.9, 97.9, 101.6, 114.3, 123.9, 125.4, 127.9, 128.0, 129.8, 130.2, 138.4, 158.8, 159.5, 160.9 ppm. mp: 178–180 °C.

ST-57: ¹H NMR (DMSO-*d*₆): δ 1.98 (d, J=3 Hz, 4H), 2.43 (s, 1H), 2.73–2.76 (m, 4H), 3.79–3.84 (m, 6H), 4.13 (s, 3H), 6.46 (d, J=4 Hz, 1H), 6.84 (d, J=4.4 Hz, 1H), 6.89 (d, J=9 Hz, 2H), 6.93 (d, J=6 Hz, 2H), 7.28 (s, 1H), 7.41 (d, J=8.4 Hz, 2H) ppm.¹³C NMR (DMSO-d₆): δ 26.1, 41.0, 48.2, 49.7, 55.6, 55.7, 55.9, 97.9, 101.6, 114.3, 123.9, 125.4, 127.9, 128.0, 129.8, 130.2, 138.4, 158.8, 159.5, 160.9 ppm. mp: 142–145 °C.

X-ray crystallographic data for the representative compounds **RES-27**, **RES-17** and **RES-54** were obtained which confirmed the *Z*-geometry (**Figure 2.4**) in these analogs (Madadi, Reddy et al. 2010, Madadi, Parkin et al. 2012).

Figure. 2.4 Crystal structures of compounds **RES-27**, **RES-17** and **RES-54**.

Scheme 2.4 Synthesis of resveratrol analogs with hydroxamine, benzylalcohol, bromo, cyano and imidazole substitutions at the C2 position (a) NH_4OH , NaOAc , ethanol, reflux 4hrs; (b) NaBH_4 , methanol; (c) imidazole, neat, MW 180 $^\circ\text{C}$, 5min (f) N-bromosuccinamide, CHCl_3 ; (g) Aq.NH_3 , I_2 , THF.

Scheme 2.5: Synthesis of resveratrol analogs with methyl, benzylalcohol and bromo substitutions at the C2 position (a) MeI, K_2CO_3 , acetone, reflux 12hrs. (c) *N*-bromosuccinamide, $CHCl_3$; (e) $NaBH_4$, methanol.

We wanted to compare the anti-cancer activity of C2 conjugated five and six-membered heterocyclic and bicyclic quinuclidinone ring systems with simpler and smaller functionalities. Below are the analytical data and reaction conditions for the synthesized compounds:

ST-138: 1H NMR (400 MHz, $DMSO-d_6$): δ 3.32 (s, 3H, $-CH_3$), 6.22 (d, $J=2$ Hz, 1H, ArH), 6.45 (d, $J=2$ Hz, 1H, ArH), 6.74 (d, $J=8.4$ Hz, 2H, ArH), 6.82 (d, $J=16$ Hz, 2H, ArH), 7.12 (d, $J=16$ Hz, 2H, ArH), 7.41 (d, $J=7.2$ Hz, 8.8H, ArH), 8.91 (s, 1H, -OH), 9.09 (s, 1H, -OH), 9.53 (s, 1H, -OH) ppm. ^{13}C NMR (100 MHz, $DMSO-d_6$): 11.2, 103.0, 112.8, 115.9, 123.9, 128.2, 128.8, 129.4, 138.1, 155.8, 156.4, 157.5 ppm.

ST-76: δ 6.38 (s, 1H, ArH), 6.63 (s, 1H, ArH), 6.79 (d, $J=5.6$ Hz, 2H, ArH), 6.96 (d, $J=16.4$ Hz, 1H, ArH), 7.18 (d, $J=16$ Hz, 1H, ArH), 7.41 (d, $J=6$ Hz, 2H, ArH), 9.44 (s,

1H, -OH), 9.62 (s, 1H, -OH), 9.99 (s, 1H, -OH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 101.2, 102.8, 104.4, 110.0, 116.0, 124.5, 128.1, 128.5, 131.2, 138.5, 155.3, 157.5, 158.0 ppm.

ST-75: δ 6.58 (s, 1H, ArH), 6.72 (s, 1H, ArH), 6.80 (d, *J* = 5.6 Hz, 2H, ArH), 6.92 (d, *J* = 16.4 Hz, 1H, ArH), 7.06 (d, *J* = 16 Hz, 1H, ArH), 7.52 (d, *J* = 6 Hz, 2H, ArH), 9.19 (s, 1H, -CHO), 9.95 (s, 1H, -OH), 10.45 (s, 1H, -OH), 10.66 (s, 1H, -OH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 98.7, 101.8, 103.3, 116.7, 116.0, 124.5, 128.1, 128.5, 134.4, 138.5, 157.5, 157.9, 193.1 ppm.

ST-82: δ 3.59 (s, 2H, -CH₂), 6.10 (s, 1H, ArH), 6.46 (s, 1H, ArH), 6.77 (d, *J* = 9.2 Hz, 2H, ArH), 6.81 (s, 1H, ArH), 7.19 (d, *J* = 16.0 Hz, 1H, ArH), 7.40 (d, *J* = 8.4 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 43.9, 101.9, 103.0, 109.5, 111.5, 115.5, 123.1, 127.9, 128.3, 129.6, 138.2, 157.0, 157.2, 158.8 ppm.

ST-05: *E*-2,4-Dimethoxy-6-(4-methoxystyryl)benzaldehyde (**RES-11**) (1mmol), hydroxylamine HCl (1.1 mmol) and sodium acetate (1.5 mmol) were dissolved in 10ml of ethanol and the resulting mixture was heated under reflux for 4 hrs. A white precipitate was formed, which was later filtered off to afford **ST-05** in 80% yield. ¹H NMR (DMSO-*d*₆): δ 3.77 (s, 3H, -OCH₃), 3.81 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 6.54 (s, 1H, -ArH), 6.89 (s, 1H, -ArH), 6.93-6.96 (d, 2H, -ArH; *J* = 8.4 Hz), 7.11-7.15 (d, 1H, -ArH; *J* = 16.4 Hz), 7.45-7.47 (d, 2H, -ArH; *J* = 8 Hz), 7.59-7.63 (d, 1H, -ArH; *J* = 16.4Hz), 8.30 (s, 1H, -ArH), 11.15 (s, 1H, -OH) ppm. ¹³C-NMR (DMSO-*d*₆): δ 55.6, 55.8, 55.3, 98.0, 102.7, 110.0, 112.6, 114.6, 126.4, 128.3, 130.1, 130.5, 138.7, 145.2, 159.4, 159.7, 161.0 ppm.

ST-130: *E*-2,4-Dimethoxy-6-(4-methoxystyryl)benzaldehyde (**RES-11**) (1mmol) was dissolved in methanol and cooled to 0 °C and LiBH₄(1.0 mmol) was added. The reaction mixture was allowed to stir for 1 hr at ambient temperature. The reaction was monitored by TLC, and after consumption of the starting materials, the reaction mixture was concentrated and extracted into ethyl acetate followed by concentration on a rotary evaporator. Flash column chromatography was carried out using an EA/hexane solvent system to afford **ST-130** in 85% yield. (**ST-130**): ¹H NMR (CDCl₃): δ 3.83 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 3.86 (s, 3H, -OCH₃), 4.79 (s, 2H, CH₂), 6.41 (s, 2H, CH₂), 6.72 (d, J=2.0 Hz, 1H), 6.91 (d, 2H, J=8.8 Hz, ArH), 6.98 (d, 1H, J=16.0 Hz, ArH), 7.36 (d, 1H, J=16.0 Hz, ArH), 7.47 (d, 2H, J= 8.4 Hz, ArH) ppm. ¹³C-NMR (DMSO-*d*₆): δ 56.1, 56.7, 56.8, 58.6, 99.4, 99.8, 101.2, 114.5, 121.3, 124.5, 125.4, 129.7, 131.2, 136.4, 153.4, 156.7, 159.6 ppm.

ST-131: Compound **ST-130** (1mmol) and imidazole (5mmol) were added to a synthetic microwave vial and irradiated for 2 min at 80 °C using a Biotage Initiator synthetic microwave. The reaction was monitored by TLC. After the starting material had completely disappeared, ethyl acetate was added and the excess imidazole was washed out with water. The ethyl acetate solvent was removed on a rotavaporator to yield **ST-131** in 95 % yield. ¹H NMR (DMSO-*d*₆): δ 3.78 (s, 3H, -OCH₃), 3.83 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 5.29 (s, 2H, -CH₂), 6.55-6.56(d, J=2 Hz, 1H, ArH), 6.79 (s, 1H, ArH), 6.86-6.87(d, J=2Hz, 1H, ArH), 6.94-6.97(d, J=8.4 Hz, 2H, ArH), 7.12-7.16 (d, J=16 Hz, 1H, ArH), 7.41-7.46 (d, J=16.4 Hz, 1H, ArH), 7.57 (s, 1H, ArH), 7.61-7.63 (d, J= 8.8 Hz, 2H, ArH) ppm. ¹³C-NMR (DMSO-*d*₆): δ 55.6, 55.7, 56.3, 98.2, 102.1, 110.0, 114.6, 115.3, 119.3, 122.6, 128.5, 128.7, 129.9, 131.9, 137.3, 139.3, 159.3, 159.7, 160.7 ppm.

ST-62: To a solution of *trans*-2-formyl-3,4',5-trimethoxystilbene (**RES-11**) (1.4 mmol) in CHCl₃ (need volume), was added drop-wise at 0-5 °C *N*-bromosuccinimide (1.7 mmol). The reaction mixture was stirred for 2 hrs and was monitored by TLC. After compound **RES-11** was consumed the mixture was added to 10 volumes of water and then extracted with 4 volumes of CH₂Cl₂. Removal of impurities from the product was achieved by column chromatography using a silica gel column and an ethyl acetate/hexane solvent system to afford **ST-62** in 65% yield. ¹H NMR (CDCl₃): δ 3.83 (s, 3H), δ 3.86 (s, 3H), δ 3.88 (s, 3H), 6.41 (s, 1H), 6.79 (s, 1H), 6.89 (d, 2H, J=8.8 Hz, ArH), 6.94 (d, 1H, J=16.0 Hz, ArH), 7.37 (d, 1H, J=16.0 Hz, ArH), 7.50 (d, 2H, J=8.8 Hz, ArH) ppm; ¹³C-NMR (CDCl₃): δ 55.1, 55.8, 100.3, 104.6, 105.1, 114.2, 127.4, 137.8, 157.9, 160.2 ppm.

ST-59: *Trans*-2-formyl-3,4',5-trimethoxystilbene (**RES-11**)(1 mmol) was dissolved in 1ml of THF and 10 ml of 28% aqueous NH₃ solution. Iodine (1.1 mmol) was added and the mixture stirred at room temperature for 1hr. The reaction mixture was quenched with Na₂S₂O₃ followed by extraction with diethyl ether to afford the nitrile product **ST-59** in 55% yield. ¹H NMR (CDCl₃): δ 3.79 (s, 3H), δ 3.82 (s, 3H, -OCH₃), δ 3.83 (s, 3H, -OCH₃), 6.46 (s, 3H, -OCH₃), 6.82 (s, 1H), 6.87 (d, 2H, J=8.8 Hz, ArH), 6.97 (d, 1H, J=16.0 Hz, ArH), 7.39 (d, 1H, J=16.0 Hz, ArH), 7.52 (d, 2H, J=8.8 Hz, ArH) ppm; ¹³C-NMR (CDCl₃): δ 56.4, 56.7, 56.9, 98.6, 99.8, 103.2, 114.5, 121.3, 124.5, 125.4, 128.7, 131.2, 136.4, 154.4, 156.7, 160.6 ppm.

ST-132(a): (*E*)-1,3-Dimethoxy-5-(4-methoxystyryl)benzene (1 mmol) was dissolved in 10 volumes of anhydrous acetone. MeI (2 eq) and K₂CO₃ (5 eq) were added to the solution and the mixture refluxed overnight to afford (*E*)-1,5-dimethoxy-3-(4-methoxystyryl)-2-methylbenzene (**ST-132(a)**) along with a mixture of unidentified

methylated products. The resveratrol analog (**ST-132(a)**) was isolated by silica gel chromatography utilizing ethyl acetate/hexane as eluting solvent in 40 % yield. (**ST-132(a)**): molecular formula: C₁₈H₂₀O₃; ¹H NMR (DMSO-*d*₆): δ 3.82-3.85 (t, *J*= 13.6 Hz, 9H, -OCH₃), 6.40-6.41(d, *J*= 2.4 Hz, 1H, ArH), 6.72-6.73(d, *J*= 2.4 Hz, 1H, ArH), 6.90-6.94 (m, *J*=18 Hz, 3H, ArH), 7.21-7.25 (d, *J*=16 Hz, 1H, ArH), 7.45-7.48 (d, *J*= 8.8 Hz, 1H, ArH) ppm. ¹³C-NMR (DMSO-*d*₆): δ 10.9, 55.3, 55.4, 55.6, 97.7, 101.2, 114.1, 117.1, 124.9, 127.8, 129.9, 130.4, 138.1, 158.3, 158.6, 159.3. ppm. mp: 55-57 °C.

2.4 Synthesis of (*Z*)-2,3-diaryl substituted acrylonitriles as anticancer agents.

2.4.1 Prior studies with this scaffold

In 2011, Tarleton and coworkers serendipitously discovered a family of 2-phenylacrylonitriles (**Figure 2.5, A**) with potent growth inhibition properties against a panel of ten human cancer cell lines: HT29 and SW480 (colon cancer), MCF-7 (breast cancer), A2780 (ovarian cancer), H460 (lung cancer), A431 (skin cancer), DU145 (prostate cancer), BEC-2 (neuroblastoma), SJ-G2 (glioblastoma), and MIA (pancreatic cancer) (Tarleton, Gilbert et al. 2011). They reported (*Z*)-2-(3,4-dichlorophenyl)-3-(4-nitrophenyl)acrylonitrile (**Figure 2.5, A**) as the lead compound from their studies with a GI₅₀ value of 0.127 μM against the (ER+ve) human breast cancer cell line, MCF-7 with a 543-fold selectivity towards MCF-7 cells compared with nine other non-breast derived cancer cell lines.

Figure 2.5 Structures of literature reported potent anti-cancer agents in the phenylacrylonitrile series.

Recently, our laboratory has reported on a series of (Z)-benzothiophene acrylonitrile analogues (**Figure 2.5, B**) as potent anti-cancer agents with GI₅₀ values generally in the range 10–100 nM against a panel of 60 human cancer cell lines. Of interest, these compounds are also able to overcome cell-associated P-glycoprotein mediated resistance, since they were equipotent in inhibiting OVCAR8 and NCI/ADR-RES cell growth (Penthala, Sonar et al. 2013).

Also, our laboratory has synthesized and evaluated a series of (Z)-quinolinyl acrylonitrile derivatives (**Figure 2.5, C, D**) as anticancer agents against a panel of 60 human cancer cell lines. Of these compounds, (Z)-3-(quinolin-2-yl)-2-(3,4,5-trimethoxyphenyl)acrylonitrile (**Figure 2.5, C**) showed potent cytotoxicity against MDA-

MB-435 melanoma and NCI-H522 non-small cell lung cancer line with GI₅₀ values of 33 nM and 37 nM, respectively. (Z)-2-(3,5-Dimethoxyphenyl)-3-(quinolin-2-yl)acrylonitrile (**Figure 2.5, D**) also displayed potent growth inhibitory activity against NCI-H522 non-small cell lung cancer lines with a GI₅₀ value of 94 nM (Penthala, Janganati et al. 2014).

Figure 2.6 Scaffolds of reported potent anticancer agents in the stilbene and phenylacrylonitrile series.

Of interest, Ohsumi *et al.* had reported (*E*)-substituted diarylacrylonitrile analogs (**Figure 2.6, G**) as effective anti-cancer agents against murine solid tumors, but failed to mention or compare the activity of their *Z*-isomers (Ohsumi, Nakagawa et al. 1998). In the current work the stilbene structural fragments present in resveratrol are modified by introducing a cyano group on the double bond bridge and incorporating methoxy substituents into the phenyl rings to improve the compound's potency. Also, a small structure-anticancer activity relationship (SAR) study was performed by comparing the GI₅₀ and TGI values from the cytotoxic assay of the synthesized substituted stilbenes (**Figure 2.6, E**) and (*E/Z*)-substituted diarylacrylonitriles analogs (**Table 2.2**).

2.4.2 Chemistry and analytical data

Scheme 2.6 Synthesis of (*Z*)-2,3-diaryl substituted acrylonitriles; reagents and conditions:
(a) 5% NaOMe, MeOH, reflux.

A series of (*Z*)-substituted diarylacrylonitrile analogs (**Table 2.2**) were synthesized by reacting substituted benzyl carbaldehydes with their corresponding substituted phenylacetonitriles in 5% sodium methoxide/methanol. The reaction mixture was stirred at room temperature for 2-3 hours. On completion of the reaction, the desired product crashed out of the solution. The precipitate was filtered off, washed with water and dried to yield the final compound in yields ranging from 70-95 % (**Scheme 2.6**). Compounds with (*Z*)-geometry can convert to their corresponding (*E*)-isomer under certain reaction conditions. This conversion is also dependent on the nature of substituents and functionalities (electron donating or accepting) on the aryl rings. However, base-catalyzed condensation reactions have been reported to form exclusively *Z*-isomer products (Penthala, Sonar et al. 2013).

* Synthetic route presented in **Scheme 2.7**.

ST-215: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 6.13 (s, 2H, -ArH), 7.55 (t, $J = 14.8$ Hz, 2H, ArH), 7.61-7.65 (m, 2H, ArH), 7.85 (d, $J = 7.2$ Hz, 2H, ArH), 7.91 (t, $J = 13.6$ Hz, 2H, ArH), 8.07 (d, $J = 8.4$ Hz, 2H, ArH), 8.11 (d, $J = 8.4$ Hz, 2H, ArH), 8.21 (s, 1H, -ArH), 8.47 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 111.3, 115.5, 121.4, 126.2, 126.3, 127.4, 128.1, 128.2, 128.9, 129.6, 129.7, 130.8, 131.8, 133.1, 134.4, 134.3, 141.5, 145.8 ppm.

ST-218: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.86 (s, 3H, -OCH₃), 4.06 (s, 3H, -OCH₃), 6.12 (s, 2H, -ArH), 7.05 (d, $J = 8.0$ Hz, 1H, ArH), 7.20 (d, $J = 7.6$ Hz, 1H, ArH), 7.39 (s, 1H, -ArH), 7.56 (d, $J = 8.4$ Hz, 1H, ArH), 7.95 (s, 1H, -ArH), 8.23 (d, $J = 10.8$ Hz, 1H,

ArH), 8.42 (d, $J = 1.2$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 57.5, 57.6, 102.2, 105.5, 105.6, 109.0, 110.2, 115.4, 115.5, 118.1, 121.1, 126.3, 126.6, 128.0, 134.9, 135.0, 138.7, 138.8, 139.3, 148.7, 148.8, 153.6 ppm.

ST-252: ^1H NMR (400 MHz, DMSO- d_6): δ 3.71 (s, 3H, -OCH₃), 4.31 (d, $J = 5.6$ Hz, 4H, -CH₂), 7.12 (d, $J = 8.8$ Hz, 1H, ArH), 7.54 (d, $J = 8$ Hz, 1H, ArH), 7.58 (s, 1H, ArH), 7.70-7.79 (m, 2H, ArH), 7.98 (d, $J = 12.8$ Hz, 2H, ArH), 8.06 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 64.4, 64.9, 107.9, 117.9, 118.0, 118.1, 118.7, 123.8, 123.8, 123.9, 125.9, 126.0, 127.3, 128.4, 129.5, 134.4, 142.6, 144.4, 149.8, 151.3 ppm.

ST-253: ^1H NMR (400 MHz, DMSO- d_6): δ 3.32 (s, 3H, -OCH₃), 3.70 (s, 3H, -OCH₃), 3.86 (s, 6H, -OCH₃), 4.25 (s, 4H, -ArH), 6.97 (s, 2H, -ArH), 7.09 (d, $J = 7.6$ Hz, 1H, ArH), 7.44 (d, $J = 8.4$ Hz, 1H, ArH), 7.58 (s, 1H, -ArH), 7.91 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.54, 60.60, 102.36, 103.64, 107.95, 108.03, 109.24, 118.74, 126.18, 128.29, 130.05, 138.67, 142.56, 148.24, 149.74, 153.67 ppm.

ST-254: ^1H NMR (400 MHz, DMSO- d_6): δ 4.31 (d, $J = 5.6$ Hz, 4H, -CH₂), 7.03 (d, $J = 7.6$ Hz, 1H, ArH), 7.34-7.51 (m, 4H, ArH), 7.56 (s, 1H, ArH), 7.72 (d, $J = 7.6$ Hz, 2H, ArH), 7.90 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 64.4, 64.9, 107.9, 117.9, 118.0, 118.1, 118.7, 123.8, 123.8, 123.9, 125.9, 126.0, 127.3, 129.3, 129.5, 134.4, 142.6, 142.7, 143.8, 146.2 ppm.

ST-255: ^1H NMR (400 MHz, DMSO- d_6): δ 4.30 (d, $J = 5.6$ Hz, 4H, -CH₂), 7.03 (d, $J = 8.8$ Hz, 1H, ArH), 7.51 (d, $J = 8$ Hz, 1H, ArH), 7.58 (s, 1H, ArH), 7.69-7.767 (m, 2H, ArH), 7.98 (d, $J = 12.8$ Hz, 2H, ArH), 8.06 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz,

DMSO-*d*₆): 64.4, 64.9, 107.9, 117.9, 118.0, 118.1, 118.7, 123.8, 123.8, 123.9, 125.9, 126.0, 127.3, 129.3, 129.5, 134.4, 142.6, 142.7, 143.8, 146.2 ppm.

ST-258: ¹H NMR (400 MHz, DMSO-*d*₆): δ 4.11 (s, 4H, -ArH), 7.12 (d, *J* = 8.4 Hz, 1H, ArH), 7.19 (d, *J* = 9.2 Hz, 1H, ArH), 7.41 (d, *J* = 1.2 Hz, 1H, ArH), 8.01-8.07 (m, 4H, ArH), 8.31 (d, *J* = 9.2 Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 102.4, 105.9, 109.1, 114.0, 1177.6, 121.9, 124.4, 127.7, 130.4, 138.8, 138.9, 140.6, 148.0, 149.1, 151.1 ppm.

ST-259: ¹H NMR (400 MHz, DMSO-*d*₆): δ 7.49 (d, *J* = 8.8 Hz, 2H, ArH), 7.69-7.75 (m, 2H, ArH), 7.82 (t, *J* = 14.0 Hz, 2H, ArH), 8.01 (t, *J* = 14.0 Hz, 2H, ArH), 8.13 (d, *J* = 8.8 Hz, 2H, ArH), 8.34 (s, 1H, -ArH), 8.35 (s, 1H, -ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 109.2, 118.1, 122.5, 123.0, 125.2, 125.3, 125.7, 126.1, 127.5, 127.6, 128.1, 128.2, 128.4, 129.0, 129.1, 129.2, 130.1, 130.3, 130.6, 130.8, 131.2, 131.4, 131.4, 132.6, 133.5, 138.4, 144.2, 149.9 ppm.

ST-260: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.71 (s, 3H, -OCH₃), 3.75 (s, 3H, -OCH₃), 7.07 (d, *J* = 8.4 Hz, 1H, ArH), 7.31 (d, *J* = 8.0 Hz, 1H, ArH), 7.62-7.66 (m, 4H, ArH), 7.95 (d, *J* = 7.2 Hz, 1H, ArH), 7.95-8.01 (m, 2H, ArH), 8.15 (m, 1H, ArH), 8.21 (s, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.07, 56.35, 102.26, 106.24, 109.02, 114.71, 118.10, 121.53, 124.76, 125.91, 127.06, 127.13, 127.41, 128.05, 129.01, 130.66, 131.47, 132.08, 133.48, 141.05, 148.81, 148.86 ppm.

ST-261: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.74 (s, 3H, -OCH₃), 3.90 (s, 6H, -OCH₃), 7.16 (s, 2H, -ArH), 7.84 (t, *J* = 14 Hz, 1H, ArH), 7.91 (d, *J* = 8.4 Hz, 1H, ArH), 8.04 (t, *J* = 19.6 Hz, 2H, ArH), 8.22 (s, 1H, -ArH), 8.53 (d, *J* = 8.4 Hz, 1H, ArH) ppm. ¹³C NMR

(100 MHz, DMSO- d_6): 56.6, 60.6, 104.4, 114.9, 117.8, 123.0, 128.0, 128.1, 128.3, 129.3, 129.7, 130.8, 137.5, 139.5, 140.7, 147.6, 152.3, 153.6 ppm.

ST-262: ^1H NMR (400 MHz, DMSO- d_6): δ 3.79 (s, 3H, -OCH₃), 7.49 (t, J =14.8 Hz, 2H, ArH), 7.54-7.58 (m, 2H, ArH), 7.79 (d, J =8.0 Hz, 2H, ArH), 7.91 (t, J =8.4 Hz, 2H, ArH), 8.02 (d, J =8.0 Hz, 2H, ArH), 8.19 (d, J =8.0 Hz, 2H, ArH), 8.27 (s, 1H, -ArH), 8.31 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.3, 112.4, 114.5, 121.4, 122.2, 126.8, 127.4, 128.1, 128.2, 128.9, 129.6, 129.7, 130.8, 132.3, 133.0, 135.1, 135.4, 143.3, 147.3 ppm.

ST-263: ^1H NMR (400 MHz, DMSO- d_6): δ 7.47 (t, J =14.4 Hz, 1H, ArH), 7.54 (t, J =14.8 Hz, 2H, ArH), 7.60-7.63 (m, 2H, ArH), 7.83 (d, J =7.2 Hz, 2H, ArH), 7.99 (t, J =13.6 Hz, 2H, ArH), 8.07 (d, J =8.4 Hz, 2H, ArH), 8.13 (d, J =8.4 Hz, 2H, ArH), 8.21 (s, 1H, -ArH), 8.43 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 110.9, 118.5, 125.4, 126.2, 126.3, 127.4, 128.1, 128.2, 128.9, 129.6, 129.7, 130.8, 131.8, 133.0, 134.0, 134.3, 143.3, 143.4 ppm.

ST-264: ^1H NMR (400 MHz, DMSO- d_6): δ 7.61 (t, J =13.6 Hz, 2H, ArH), 7.74-7.82 (m, 2H, ArH), 7.98 (t, J =14.4 Hz, 2H, ArH), 8.07 (t, J =16.8 Hz, 2H, ArH), 8.13 (d, J =8.8 Hz, 2H, ArH), 8.38 (s, 1H, -ArH), 8.45 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 109.2, 118.1, 122.5, 123.0, 125.2, 125.3, 125.7, 126.1, 127.5, 127.6, 128.1, 128.2, 128.4, 129.0, 129.1, 129.2, 130.2, 130.3, 130.6, 130.8, 130.9, 131.4, 131.4, 132.9, 134.2, 135.4, 145.1, 145.2 ppm.

ST-179: ^1H NMR (400 MHz, DMSO- d_6): δ 3.85(s, 3H, -OCH₃), 6.09 (s, 2H, -ArH), 7.59 (d, J =14.2 Hz, 2H, ArH), 7.59-7.63 (m, 2H, ArH), 7.81 (d, J =8.0 Hz, 2H, ArH),

7.91 (t, $J = 14.8$ Hz, 2H, ArH), 7.98 (d, $J = 8.0$ Hz, 2H, ArH), 8.02 (d, $J = 8.0$ Hz, 2H, ArH), 8.12 (s, 1H, -ArH), 8.24 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.52, 109.2, 112.1, 118.4, 121.2, 123.3, 125.4, 126.1, 128.2, 128.9, 129.6, 129.7, 130.8, 131.8, 133.1, 134.4, 141.5, 142.4 ppm.

ST-181: ^1H NMR (400 MHz, DMSO- d_6): δ 3.81 (s, 3H, -OCH₃), 6.11 (s, 2H, -CH₂), 6.56 (t, $J = 4$ Hz, 1H, ArH), 6.82 (s, 1H, ArH), 7.11 (d, $J = 7.6$ Hz, 1H, ArH), 7.46 (d, $J = 7.6$ Hz, 1H, ArH), 7.59 (d, $J = 8$ Hz, 1H, ArH), 7.96 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.0, 101.0, 102.3, 104.2, 107.7, 108.8, 118.6, 126.4, 128.1, 136.3, 142.3, 148.2, 148.9, 155.1 ppm.

ST-216: ^1H NMR (400 MHz, DMSO- d_6): δ 6.08 (s, 2H, -CH₂), 7.47-7.52 (m, 4H, ArH), 7.60-7.71 (m, 5H, ArH), 8.07 (d, $J = 8.4$ Hz, 2H, ArH), 8.13 (d, $J = 8.4$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 108.1, 112.3, 114.3, 114.6, 116.7, 125.4, 126.2, 126.3, 127.4, 127.8, 128.1, 128.5, 129.6, 129.7, 130.8, 131.8, 133.1, 133.2, 134.3, 141.0, 142.8 ppm.

ST-185: ^1H NMR (400 MHz, DMSO- d_6): δ 3.76 (s, 3H, -OCH₃), 3.81 (s, 3H, -OCH₃), 6.19 (s, 2H, -ArH), 7.12 (d, $J = 8.0$ Hz, 1H, ArH), 7.16 (d, $J = 8.4$ Hz, 1H, ArH), 7.30 (s, 1H, -ArH), 7.39 (s, 1H, -ArH), 7.79 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.6, 56.1, 102.2, 105.5, 106.0, 109.0, 109.8, 118.71, 120.7, 128.5, 129.7, 132.4, 141.1, 148.6, 153.4 ppm.

ST-156: ^1H NMR (400 MHz, DMSO- d_6): δ 6.11 (s, 2H, -ArH), 7.10 (d, $J = 8.4$ Hz, 1H, ArH), 7.15 (d, $J = 8.8$ Hz, 1H, ArH), 7.41 (d, $J = 4.0$ Hz, 1H, ArH), 8.11-8.15 (m, 4H, ArH), 8.31 (d, $J = 8.0$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 101.4, 102.1,

105.9, 109.1, 114.0, 1177.6, 121.9, 124.4, 127.7, 130.4, 138.8, 138.9, 140.6, 148.0, 149.1, 151.1 ppm.

ST-145: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.69 (s, 3H, $-\text{OCH}_3$), 3.86 (s, 9H, $-\text{OCH}_3$), 6.97 (s, 2H, $-\text{ArH}$), 7.07-7.09 (d, $J=8.4$ Hz, 1H, ArH), 7.38 (d, $J=8.4$ Hz, 1H, ArH), 7.51 (s, 1H, ArH), 7.84 (s, 1H, ArH), 9.42 (s, 1H, $-\text{OH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 56.08, 56.52, 60.58, 103.52, 107.09, 112.39, 115.61, 118.88, 122.96, 130.37, 138.45, 143.00, 146.93, 150.50, 153.63 ppm. HRMS (ESI): m/z calcd for $\text{C}_{19}\text{H}_{19}\text{NO}_5$ [M-H] 342.1341; found 342.1331.

ST-507: yellow solid; ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.79 (s, 3H, $-\text{OCH}_3$), 3.84(s, 3H, $-\text{OCH}_3$), 3.85(s, 3H, $-\text{OCH}_3$), 7.04-7.07 (t, $J=15.2$ Hz, 2H, ArH), 7.20 (dd, $J=2, 8.8$ Hz, 1H, ArH), 7.29 (s, 1H, ArH), 7.35 (dd, $J=1.6, 8.4$ Hz, 1H, ArH), 7.49 (s, 1H, ArH), 7.77(s, 1H, ArH), 9.38 (s, 1H, $-\text{OH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.93, 55.96, 56.02, 56.13, 56.16, 56.23, 107.16, 108.79, 112.23, 112.34, 112.39, 115.41, 115.65, 118.94, 118.97, 119.08, 122.75, 127.20, 127.29, 141.15, 141.37, 146.90, 149.53, 149.91, 150.22 ppm.

ST-198: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.64 (s, 3H, $-\text{OCH}_3$), 3.74 (s, 3H, $-\text{OCH}_3$), 3.79 (s, 6H, $-\text{OCH}_3$), 6.85 (s, 2H, $-\text{ArH}$), 6.91 (d, $J=8.8$ Hz, 2H, ArH), 6.97 (d, $J=16.4$ Hz, 1H, ArH), 7.11 (d, $J=16.4$ Hz, 1H, ArH), 7.11 (d, $J=8.8$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.56, 56.29, 60.50, 103.99, 114.64, 126.73, 127.87, 128.03, 130.20, 133.56, 137.42, 153.48, 159.29 ppm.

ST-148: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.67 (s, 3H, $-\text{OCH}_3$), 3.81 (s, 3H, $-\text{OCH}_3$), 3.83 (s, 6H, $-\text{OCH}_3$), 6.96 (s, 2H, $-\text{ArH}$), 7.07 (d, $J=8.4$ Hz, 1H, ArH), 7.89-7.91(m, 3H,

ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.88, 56.2, 60.59, 103.58, 107.54, 114.92, 118.89, 126.72, 130.22, 131.47, 138.56, 142.59, 153.65, 161.48 ppm.

ST-147: ^1H NMR (400 MHz, DMSO- d_6): δ 3.71 (s, 3H, -OCH₃), 3.80 (s, 6H, -OCH₃), 3.87 (s, 6H, -OCH₃), 6.65 (s, 1H, -ArH), 7.01 (s, 2H, -ArH), 7.12 (d, $J=2$ Hz, 2H, ArH), 7.96 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.32, 57.05, 61.10, 103.39, 104.39, 107.97, 111.57, 118.82, 130.18, 136.34, 139.49, 143.28, 154.16, 161.49 ppm.

ST-124: ^1H NMR (400 MHz, DMSO- d_6): δ 3.79 (s, 6H, -OCH₃), 3.81 (s, 3H, -OCH₃), 3.71 (s, 6H, -OCH₃), 6.62 (s, 1H, -ArH), 7.05-7.10 (m, 4H, ArH), 7.69 (d, $J=8.8$ Hz, 2H, ArH), 7.84 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.1, 55.4, 55.6, 111.4, 114.5, 115.9, 118.8, 126.7, 134.2, 135.1, 138.6, 142.9, 147.1, 149.1 ppm.

ST-126: ^1H NMR (400 MHz, DMSO- d_6): δ 3.58 (s, 3H, -OCH₃), 3.63 (s, 3H, -OCH₃), 3.71 (s, 6H, -OCH₃), 7.12 (s, 2H, -ArH), 7.15 (d, $J=8.0$ Hz, 2H, ArH), 7.21 (d, $J=8.8$ Hz, 2H, ArH), 7.36 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.88, 55.2, 56.9, 101.5, 104.5, 114.9, 118.8, 126.7, 134.2, 135.1, 138.6, 142.9, 154.5, 155.8 ppm.

ST-177: ^1H NMR (400 MHz, DMSO- d_6): δ 3.84 (s, 3H, -OCH₃), 3.86 (s, 3H, -OCH₃), 6.13 (s, 2H, -ArH), 6.67 (d, $J=8.4$ Hz, 2H, ArH), 7.00 (d, $J=8.0$ Hz, 1H, ArH), 7.12- (d, $J=8.4$ Hz, 1H, ArH), 7.25 (s, 1H, -ArH), 7.78 (s, 1H, -ArH), 7.92 (d, $J=8.8$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.99, 56.31, 98.79, 120.11, 105.75, 106.09, 108.38, 109.08, 115.85, 118.84, 120.48, 129.02, 129.40, 136.61, 148.34, 148.68, 159.61, 163.15 ppm.

ST-178: ^1H NMR (400 MHz, DMSO- d_6): δ 6.14 (s, 2H, -CH₂), 7.07 (d, $J=8.4$ Hz, 1H, ArH), 7.31 (d, $J=8.0$ Hz, 1H, ArH), 7.62-7.66 (m, 4H, ArH), 7.95 (d, $J=7.2$ Hz, 1H,

ArH), 8.01 (m, 2H, ArH), 8.16 (m, 1H, ArH), 8.61 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 102.26, 106.24, 109.02, 114.71, 118.10, 121.53, 124.76, 125.91, 127.06, 127.13, 127.41, 128.05, 129.01, 130.66, 131.47, 132.08, 133.48, 140.07, 148.80, 148.95 ppm.

ST-180: ^1H NMR (400 MHz, DMSO- d_6): δ 6.12 (s, 2H, $-\text{CH}_2$), 7.03 (d, $J=8.0$ Hz, 1H, ArH), 7.21 (d, $J=8.4$ Hz, 1H, ArH), 7.43-7.46 (m, 4H, ArH), 7.95 (s, 2H, ArH), 8.05 (d, $J=7.6$ Hz, 1H, ArH), 8.28 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 102.30, 105.61, 109.02, 109.14, 118.16, 121.23, 123.15, 125.12, 125.66, 127.08, 127.89, 131.72, 1234.80, 137.98, 138.59, 140.67, 148.84, 148.89 ppm.

ST-160: ^1H NMR (400 MHz, DMSO- d_6): δ 3.32 (s, 3H, $-\text{OCH}_3$), 3.70 (s, 3H, $-\text{OCH}_3$), 3.86 (s, 6H, $-\text{OCH}_3$), 6.14 (s, 2H, $-\text{ArH}$), 6.97 (s, 2H, $-\text{ArH}$), 7.09 (d, $J=7.6$ Hz, 1H, ArH), 7.44 (d, $J=8.4$ Hz, 1H, ArH), 7.58 (s, 1H, $-\text{ArH}$), 7.91 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.54, 60.60, 102.36, 103.64, 107.95, 108.03, 109.24, 118.74, 126.18, 128.29, 130.05, 138.67, 142.56, 148.24, 149.74, 153.67 ppm.

ST-163: ^1H NMR (400 MHz, DMSO- d_6): δ 3.83 (s, 3H, $-\text{OCH}_3$), 6.09 (s, 2H, $-\text{ArH}$), 7.01 (d, $J=8.4$ Hz, 1H, ArH), 7.07 (d, $J=8.8$ Hz, 2H, ArH), 7.15 (d, $J=10.4$ Hz, 1H, ArH), 7.36 (d, $J=1.6$ Hz, 1H, ArH), 7.83 (s, 1H, $-\text{ArH}$), 7.88 (d, $J=8.8$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.54, 60.60, 102.36, 103.64, 107.95, 108.03, 109.24, 118.74, 126.18, 128.29, 130.05, 138.67, 142.56, 148.24, 149.74, 153.67 ppm.

ST-173: ^1H NMR (400 MHz, DMSO- d_6): δ 3.84 (s, 3H, $-\text{OCH}_3$), 3.86 (s, 3H, $-\text{OCH}_3$), 6.09 (s, 2H, $-\text{ArH}$), 6.67 (d, $J=8.4$ Hz, 2H, ArH), 7.00 (d, $J=8.0$ Hz, 2H, ArH), 7.12- (d, $J=8.4$ Hz, 1H, ArH), 7.25 (s, 1H, $-\text{ArH}$), 7.78 (s, 1H, $-\text{ArH}$), 7.92 (d, $J=8.8$ Hz, 1H,

ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.99, 56.31, 98.79, 120.11, 105.75, 106.09, 108.38, 109.08, 115.85, 118.84, 120.48, 129.02, 129.40, 136.61, 148.34, 148.68, 159.61, 163.15 ppm.

ST-162: ^1H NMR (400 MHz, DMSO- d_6): δ 3.74 (s, 3H, -OCH₃), 3.82 (s, 6H, -OCH₃), 6.11 (s, 2H, -ArH), 7.03 (d, $J=7.6$ Hz, 1H, ArH), 7.18 (d, $J=8.0$ Hz, 1H, ArH), 7.31 (s, 2H, -ArH), 7.39 (s, 1H, -ArH), 7.87 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.26, 56.37, 60.60, 102.22, 105.56, 107.08, 109.00, 109.08, 118.71, 120.87, 128.50, 129.57, 139.74, 141.61, 148.62, 148.78, 153.24 ppm.

ST-521: ^1H NMR (400 MHz, DMSO- d_6): δ 3.95 (s, 3H, -OCH₃), 6.13 (d, $J=8.4$ Hz, 2H, ArH), 7.21 (d, $J=8.4$ Hz, 2H, ArH), 7.27 (s, 1H, ArH), 7.44 (d, $J=9.2$ Hz, 1H, ArH), 8.06 (d, $J=8.4$ Hz, 1H, ArH), 8.26 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 57.3, 112.3, 112.7, 115.1, 119.2, 119.9, 124.3, 126.3, 127.5, 128.8, 133.8, 139.5, 151.7, 174.8 ppm.

ST-149: ^1H NMR (400 MHz, DMSO- d_6): δ 3.71-3.75 (m, 6H, -OCH₃), 3.84 (s, 6H, -OCH₃), 3.87 (s, 6H, -OCH₃), 7.00 (s, 2H, -ArH), 7.32 (s, 2H, ArH), 7.94 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 60.5, 60.6, 103.6, 107.2, 109.4, 118.7, 129.4, 129.8, 138.8, 139.9, 142.8, 153.2, 153.6 ppm.

ST-152: ^1H NMR (400 MHz, DMSO- d_6): δ 3.88 (s, 3H, -OCH₃), 7.07 (t, $J=15.2$ Hz, 1H, ArH), 7.17 (d, $J=8.4$ Hz, 1H, ArH), 7.49 (d, $J=7.2$ Hz, 2H, ArH), 7.65 (s, 1H, ArH), 7.97 (s, 1H, ArH), 8.08 (s, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.3, 111.4, 112.5, 117.5, 121.4, 123.2, 123.8, 130.3, 130.8, 131.8, 135.1, 138.0, 143.2, 157.0 ppm.

ST-153: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.80 (s, 3H, $-\text{OCH}_3$), 6.13 (s, 2H, $-\text{ArH}$), 7.06 (t, $J=18$ Hz, 3H, ArH), 7.41 (d, $J=9.6$ Hz, 1H, ArH), 7.55 (s, 1H, $-\text{ArH}$), 7.65 (d, $J=8.4$ Hz, 2H, ArH), 7.79 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.7, 55.85, 102.2, 107.7, 107.8, 107.9, 109.2, 115.0, 115.2, 118.8, 125.8, 126.7, 127.4, 128.5, 140.7, 140.8, 148.1, 149.4, 160.2 ppm.

ST-164: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.79 (s, 6H, $-\text{OCH}_3$), 6.11 (s, 2H, $-\text{ArH}$), 6.62 (s, 1H, $-\text{ArH}$), 7.05 (d, $J=7.6$ Hz, 1H, ArH), 7.10 (s, 2H, $-\text{ArH}$), 7.21 (d, $J=7.6$ Hz, 1H, ArH), 7.39 (s, 1H, $-\text{ArH}$), 7.85 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.7, 102.2, 102.7, 105.7, 107.3, 109.0, 110.6, 118.3, 121.1, 128.3, 135.9, 141.4, 148.7, 148.8, 160.9 ppm.

ST-165: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.80 (s, 3H, $-\text{OCH}_3$), 3.83 (s, 3H, $-\text{OCH}_3$), 6.10 (s, 2H, $-\text{ArH}$), 7.03 (d, $J=8$ Hz, 1H, ArH), 7.11 (d, $J=8.4$ Hz, 1H, ArH), 7.18 (d, $J=10.4$ Hz, 1H, ArH), 7.37 (d, $J=2$ Hz, 1H, ArH), 7.52 (d, $J=10$ Hz, 1H, ArH), 7.62 (d, $J=1.6$ Hz, 1H, ArH), 7.83 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.7, 55.8, 56.0, 56.1, 102.1, 105.5, 105.5, 107.1, 109.0, 112.1, 119.0, 120.5, 123.7, 126.8, 128.8, 141.6, 141.7, 148.3, 148.3, 148.9, 151.1 ppm.

ST-168: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 6.14 (s, 2H, $-\text{ArH}$), 7.17 (d, $J=8.4$ Hz, 1H, ArH), 7.28 (t, $J=16.0$ Hz, 2H, ArH), 7.41 (d, $J=8.4$ Hz, 1H, ArH), 7.51-7.56 (m, 3H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 101.3, 106.2, 107.8, 107.9, 109.4, 112.7, 112.9, 117.6, 124.6, 124.8, 126.3, 126.9, 127.3, 130.5, 148.4, 150.6, 151.0, 158.5, 158.6 ppm.

ST-486: ^1H NMR (400 MHz, DMSO- d_6): δ 3.74 (s, 3H, -OCH₃), 3.90 (s, 6H, -OCH₃), 7.16 (s, 2H, -ArH), 7.84 (t, J =14 Hz, 1H, ArH), 7.91 (d, J =8.4 Hz, 2H, ArH), 8.04 (t, J =19.6 Hz, 2H, ArH), 8.22 (s, 1H, -ArH), 8.53 (d, J =8.4 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.6, 60.6, 104.4, 114.9, 117.8, 123.0, 128.0, 128.1, 128.3, 129.3, 129.7, 130.8, 137.5, 139.5, 140.7, 147.6, 152.3, 153.6 ppm.

ST-479: ^1H NMR (400 MHz, DMSO- d_6): δ 3.79 (s, 3H, -OCH₃), 3.84 (s, 3H, -OCH₃), 4.31 (d, J =4 Hz, 4H, ArH), 7.01 (d, J =8.0 Hz, 1H, ArH), 7.05 (d, J =8.4 Hz, 1H, ArH), 7.22 (d, J =8.4 Hz, 1H, ArH), 7.28 (s, 1H, -ArH), 7.44 (d, J =8.4 Hz, 1H, ArH), 7.52 (s, 1H, -ArH), 7.80 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.0, 56.1, 64.4, 64.8, 107.9, 108.9, 112.2, 117.7, 117.9, 118.8, 119.1, 123.5, 127.0, 127.6, 140.5, 143.7, 145.8, 149.5, 150.0 ppm. HRMS (ESI): m/z calcd for C₁₉H₁₈NO₄ [M-H] 324.1236; found 324.1224.

ST-161: ^1H NMR (400 MHz, DMSO- d_6): δ 6.10 (s, 2H, -ArH), 6.13 (s, 2H, -ArH), 7.04 (d, J =8.4 Hz, 1H, ArH), 7.09 (d, J =8.4 Hz, 1H, ArH), 7.17 (d, J =8.4 Hz, 1H, ArH), 7.37 (d, J =1.6 Hz, 1H, ArH), 7.42 (d, J =8.0 Hz, 1H, ArH), 7.54 (s, 2H, -ArH), 7.82 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 102.1, 12.3, 105.5, 105.6, 107.6, 107.8, 107.9, 109.0, 109.2, 118.7, 120.7, 125.9, 128.3, 128.6, 141.2, 141.3, 148.1, 148.4, 148.7, 149.5 ppm.

ST-156: ^1H NMR (400 MHz, DMSO- d_6): δ 6.17 (s, 2H, -ArH), 7.15 (d, J =8.0 Hz, 1H, ArH), 7.55 (d, J =8.4 Hz, 1H, ArH), 7.65 (d, J =1.6 Hz, 1H, ArH), 7.99 (d, J =9.2 Hz, 1H, ArH), 8.19 (s, 1H, -ArH), 8.34 (d, J =8.8 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz,

DMSO-*d*₆): 102.6, 105.8, 108.1, 108.2, 109.4, 118.1, 124.7, 127.0, 127.5, 127.7, 140.8, 146.3, 146.4, 147.4, 148.3, 150.7 ppm.

ST-175: ¹H NMR (400 MHz, DMSO-*d*₆): δ 6.19 (s, 2H, -ArH), 7.23 (s, 1H, -ArH), 7.26 (s, 1H, -ArH), 7.29 (d, *J* = 7.6 Hz, 1H, ArH), 7.32 (s, 1H, -ArH), 7.51 (d, *J* = 7.6 Hz, 2H, ArH), 7.56 (d, *J* = 8.0 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 102.9, 108.7, 118.2, 121.7, 129.6, 131.5, 138.8, 144.3, 145.9, 153.6 ppm.

ST-287: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.88 (s, 3H, -OCH₃), 3.93 (s, 6H, -OCH₃), 6.81 (s, 2H, -ArH), 7.23 (s, 1H, -ArH), 7.26 (s, 2H, -ArH), 7.32 (s, 1H, -ArH), 7.52 (s, 1H, -ArH), 7.95 (s, 1H, -ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.2, 56.3, 60.9, 102.9, 108.7, 110.1, 118.2, 121.7, 129.6, 131.5, 138.8, 144.3, 145.8, 145.9, 153.6 ppm.

ST-288: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.84 (s, 3H, -OCH₃), 6.95 (d, *J* = 8.0 Hz, 2H, ArH), 7.21 (s, 1H, -ArH), 7.28 (s, 1H, ArH), 7.50 (s, 1H, -ArH), 7.56 (d, *J* = 9.2 Hz, 2H, ArH), 7.91 (s, 1H, -ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.3, 55.4, 108.7, 109.8, 114.4, 118.3, 121.9, 126.4, 126.8, 129.9, 144.2, 145.3, 145.4, 160.1 ppm.

ST-166: ¹H NMR (400 MHz, DMSO-*d*₆): δ 4.00 (s, 3H, -OCH₃), 6.12 (s, 2H, -ArH), 7.05 (d, *J* = 8.0 Hz, 1H, ArH), 7.20 (d, *J* = 7.6 Hz, 1H, ArH), 7.39 (s, 1H, -ArH), 7.56 (d, *J* = 8.4 Hz, 1H, ArH), 7.95 (s, 1H, -ArH), 8.23 (d, *J* = 10.8 Hz, 1H, ArH), 8.42 (d, *J* = 1.2 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 57.6, 102.2, 105.5, 105.6, 109.0, 110.2, 115.4, 115.5, 118.1, 121.1, 126.3, 126.6, 128.0, 134.9, 135.0, 138.7, 138.8, 139.3, 148.7, 148.8, 153.6 ppm.

ST-172: ¹H NMR (400 MHz, DMSO-*d*₆): δ 6.12 (s, 2H, -ArH), 7.06 (d, *J* = 8.0 Hz, 1H, ArH), 7.20 (d, *J* = 10.4 Hz, 1H, ArH), 7.39 (d, *J* = 2 Hz, 1H, ArH), 7.56 (t, *J* = 17.2 Hz,

1H, ArH), 7.91-7.97 (m, 2H, -ArH), 8.23 (dd, $J=8.8$ Hz, $J=2.4$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 102.3, 105.7, 105.8, 108.9, 109.0, 109.1, 111.4, 117.6, 117.9, 117.9, 121.9, 127.9, 130.5, 130.6, 130.7, 132.6, 134.5, 134.6, 138.7, 148.7, 149.0, 158.0, 160.5 ppm.

ST-167: ^1H NMR (400 MHz, DMSO- d_6): δ 6.13 (s, 2H, -ArH), 7.08 (d, $J=8.4$ Hz, 1H, ArH), 7.28 (d, $J=9.2$ Hz, 1H, ArH), 7.47 (d, $J=1.2$ Hz, 1H, ArH), 8.08-8.10 (m, 4H, ArH), 8.36 (d, $J=9.2$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 102.4, 105.9, 109.1, 114.0, 1177.6, 121.9, 124.4, 127.7, 130.4, 138.8, 138.9, 140.6, 148.0, 148.8, 149.4 ppm.

ST-184: ^1H NMR (400 MHz, DMSO- d_6): δ 6.17 (s, 2H, -ArH), 7.13 (d, $J=8.0$ Hz, 1H, ArH), 7.29 (t, $J=16.4$ Hz, 2H, ArH), 7.46 (d, $J=6.8$ Hz, 1H, ArH), 7.55-7.63 (m, 3H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 94.0, 102.6, 107.8, 107.9, 109.4, 112.7, 112.9, 117.6, 126.9, 127.3, 130.5, 148.4, 150.6, 151.0, 158.5, 158.6, 160.9, 161.0 ppm.

ST-101: ^1H NMR (400 MHz, DMSO- d_6): δ 3.81 (s, 6H, -OCH₃), 6.71 (s, 1H, -ArH), 7.21 (s, 2H, -ArH), 8.04 (d, $J=9.2$ Hz, 2H, ArH), 8.25 (s, 1H, -ArH), 8.37 (d, $J=8.8$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.8, 99.5, 99.6, 105.4, 118.5, 124.5, 125.6, 125.8, 132.4, 136.5, 140.8, 147.1 ppm.

TMR-01: ^1H NMR (400 MHz, DMSO- d_6): δ 3.72 (s, 3H, -OCH₃), 3.87 (s, 6H, -OCH₃), 7.06 (s, 2H, -ArH), 8.12 (d, $J=8.8$ Hz, 2H, ArH), 8.17 (s, 1H, -ArH), 8.38 (d, $J=8.4$ Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.5, 60.6, 104.2, 114.3, 117.6, 124.5, 130.5, 139.5, 140.25, 140.4, 148.1, 153.7 ppm.

TMR-03: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.72 (s, 3H, $-\text{OCH}_3$), 3.87 (s, 6H, $-\text{OCH}_3$), 7.05 (s, 2H, $-\text{ArH}$), 7.83 (t, $J = 16$ Hz, 1H, ArH), 8.19 (s, 1H, $-\text{ArH}$), 8.29 (d, $J = 8.4$ Hz, 1H, ArH), 8.36 (d, $J = 8.0$ Hz, 1H, ArH), 8.73 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 56.5, 60.6, 104.0, 113.1, 117.7, 124.3, 125.0, 129.0, 131.0, 134.9, 135.7, 139.3, 140.1, 148.4, 153.7 ppm.

TMR-04: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.71 (s, 3H, $-\text{OCH}_3$), 3.86 (s, 6H, $-\text{OCH}_3$), 4.01 (s, 3H, $-\text{OCH}_3$), 7.01 (s, 2H, $-\text{ArH}$), 7.60 (d, $J = 9.2$ Hz, 1H, ArH), 8.07 (s, 1H, $-\text{ArH}$), 8.29 (d, $J = 8.8$ Hz, 1H, ArH), 8.44 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.4, 56.2, 56.3, 60.9, 102.9, 108.7, 110.1, 118.2, 121.7, 124.2, 124.5, 124.8, 129.6, 131.5, 138.8, 144.3, 145.8, 145.9, 153.6 ppm.

ST-155: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.86 (s, 6H, $-\text{OCH}_3$), 6.14 (s, 2H, $-\text{CH}_2$), 6.56 (t, $J = 4$ Hz, 1H, ArH), 6.85 (d, $J = 2$ Hz, 1H, ArH), 7.11 (d, $J = 7.6$ Hz, 1H, ArH), 7.46 (d, $J = 7.6$ Hz, 1H, ArH), 7.59 (d, $J = 8$ Hz, 1H, ArH), 7.96 (s, 1H, $-\text{ArH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.9, 101.0, 102.3, 104.2, 107.7, 108.1, 109.2, 118.6, 126.4, 128.1, 136.3, 143.3, 148.2, 149.9, 161.3 ppm.

ST-512: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.58 (s, 3H, $-\text{OCH}_3$), 3.61 (s, 3H, $-\text{OCH}_3$), 6.52 (d, $J = 8.0$ Hz, 2H, ArH), 6.87 (d, $J = 8.4$ Hz, 2H, ArH), 6.95 (s, 2H, $-\text{ArH}$), 7.12 (s, 1H, $-\text{ArH}$), 7.36 (s, 1H, $-\text{ArH}$), 9.15 (s, 1H, $-\text{OH}$) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 57.9, 58.2, 101.5, 104.8, 115.4, 118.8, 125.0, 127.5, 129.8, 139.5, 145.2, 151.1, 151.5 ppm.

ST-514: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.73 (s, 3H, $-\text{OCH}_3$), 3.82 (s, 6H, $-\text{OCH}_3$), 6.89 (d, $J = 8.8$ Hz, 2H, ArH), 7.29 (s, 2H, $-\text{ArH}$), 7.57 (d, $J = 8.4$ Hz, 2H, ArH), 7.75 (s,

1H, -ArH), 9.94 (s, 1H, -OH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.3, 60.6, 106.9, 109.4, 116.3, 118.8, 125.0, 127.5, 129.8, 139.5, 140.1, 153.2, 158.9 ppm.

ST-516: ¹H NMR (400 MHz, DMSO-*d*₆): δ 7.55 (d, *J* = 14.8 Hz, 2H, ArH), 7.61-7.65 (m, 2H, ArH), 7.85 (d, *J* = 7.2 Hz, 2H, ArH), 7.91 (t, *J* = 8.6 Hz, 1H, ArH), 8.07 (d, *J* = 8.4 Hz, 2H, ArH), 8.11 (d, *J* = 8.4 Hz, 2H, ArH), 8.21 (s, 1H, -ArH), 9.94 (s, 1H, -OH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 111.3, 115.5, 121.4, 126.2, 126.3, 127.4, 128.1, 128.2, 128.9, 129.6, 129.7, 130.8, 131.8, 133.1, 134.4, 134.3, 141.5, 145.8 ppm.

ST-520: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.79 (s, 3H, -OCH₃), 6.89 (d, *J* = 8.4 Hz, 2H, ArH), 6.89 (d, *J* = 8.4 Hz, 2H, ArH), 6.89 (d, *J* = 8.0 Hz, 2H, ArH), 7.29 (s, 2H, -ArH), 7.57 (d, *J* = 8.0 Hz, 2H, ArH), 9.94 (s, 1H, -OH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 55.8, 107.7, 114.8, 116.3, 119.0, 125.3, 127.0, 127.3, 131.1, 139.8, 158.6, 161.0 ppm.

ST-517: ¹H NMR (400 MHz, DMSO-*d*₆): δ 6.12 (s, 2H, -ArH), 6.87 (d, *J* = 8.4 Hz, 2H, ArH), 7.07 (d, *J* = 8.4 Hz, 1H, ArH), 7.38 (d, *J* = 10 Hz, 1H, ArH), 7.52-7.54 (m, 3H, ArH), 7.71 (s, 1H, -ArH), 9.88 (s, 1H, -OH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.3, 60.6, 106.9, 109.4, 116.3, 118.8, 125.0, 127.5, 129.8, 139.5, 140.1, 153.2, 158.9 ppm.

ST-315: ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.68 (s, 3H, -OCH₃), 3.83 (s, 6H, -OCH₃), 6.97 (s, 2H, -ArH), 7.28-7.43 (m, 3H, ArH), 7.76 (d, *J* = 8 Hz, 2H, ArH), 7.83 (d, *J* = 7.2 Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.3, 60.5, 104.9, 110.4, 114.5, 119.5, 124.8, 125.1, 126.5, 127.3, 133.0, 153.5 ppm.

ST-301: ¹H NMR (400 MHz, DMSO-*d*₆): δ 7.28 (d, *J* = 16.4 Hz, 1H, ArH), 7.41 (d, *J* = 16.4 Hz, 1H, ArH), 7.46 (d, *J* = 8.4 Hz, 2H, ArH), 7.57-7.64 (m, 4H, ArH), 7.89 (d, *J* = 2

Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 127.1, 127.2, 128.5, 128.8, 129.2, 129.9, 130.2, 131.2, 131.9, 132.9, 135.9, 138.2 ppm.

ST-321: ^1H NMR (400 MHz, DMSO- d_6): δ 4.00 (s, 3H, -OCH₃), 7.04 (d, J =8.4 Hz, 1H, ArH), 7.17 (d, J =16.0 Hz, 1H, ArH), 7.54-7.61 (m, 4H, ArH), 7.71 (d, J =8.4 Hz, 2H, ArH), 7.84 (d, J =8.0 Hz, 1H, ArH), 8.04 (d, J =16 Hz, 1H, ArH), 8.22 (d, J =8.4 Hz, 1H, ArH), 8.38 (d, J =8.0 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.1, 105.0, 120.6, 122.3, 124.2, 124.3, 125.2, 125.8, 126.2, 126.7, 127.2, 128.3, 129.0, 131.9, 132.0, 137.3, 155.3 ppm.

ST-302: ^1H NMR (400 MHz, DMSO- d_6): δ 7.52 (d, J =8.4 Hz, 2H, ArH), 7.65 (d, J =8.8 Hz, 2H, ArH), 7.85 (d, J =2.8 Hz, 2H, ArH), 7.95 (s, 1H, ArH), 8.25 (d, J =5.6 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 124.5, 127.6, 128.0, 128.9, 129.0, 130.9, 131.1, 131.3, 132.0, 137.6, 143.8, 146.9 ppm.

ST-312: ^1H NMR (400 MHz, DMSO- d_6): δ 6.03 (s, 2H, -ArH), 6.91 (s, 1H, -ArH), 7.01-7.10 (m, 2H, ArH), 7.22 (d, J =8 Hz, 1H, ArH), 7.27 (s, 1H, -ArH), 7.47-7.54 (m, 4H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 101.5, 105.7, 108.8, 120.5, 122.3, 125.7, 128.5, 129.5, 131.7, 131.9, 137.0, 147.6, 148.3 ppm.

ST-313: ^1H NMR (400 MHz, DMSO- d_6): δ 7.44 (d, J =1.6 Hz, 2H, ArH), 7.59-7.65 (m, 2H, ArH), 7.77 (d, J =8.4 Hz, 2H, ArH), 7.84 (d, J =8.4 Hz, 2H, ArH), 7.91 (d, J =1.6 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 110.4, 119.3, 127.4, 127.7, 128.8, 129.5, 129.9, 130.8, 131.3, 132.0, 133.0, 137.7, 141.6 ppm.

ST-309: ^1H NMR (400 MHz, DMSO- d_6): δ 3.66 (s, 3H, -OCH₃), 3.83 (s, 6H, -OCH₃), 6.11 (s, 2H, -ArH), 6.83-6.88 (m, 4H, ArH), 7.04 (dd, J =1.2 Hz, J =1.8 Hz, 1H, ArH),

7.14 (d, $J=16.4$ Hz, 1H, ArH), 7.28 (d, $J=16.4$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 51.6, 56.3, 60.5, 101.3, 130.2, 107.7, 120.1, 122.2, 122.8, 131.7, 153.5 ppm.

ST-316: ^1H NMR (400 MHz, DMSO- d_6): δ 3.67 (s, 3H, -OCH₃), 3.83 (s, 6H, -OCH₃), 6.93 (s, 2H, -ArH), 7.21 (s, 2H, -ArH), 7.55 (dd, $J=8.8$ Hz, $J=13.6$ Hz, 4H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.3, 60.5, 104.4, 120.7, 126.9, 128.6, 129.7, 132.0, 132.9, 136.9, 137.9, 153.5 ppm.

ST-323: ^1H NMR (400 MHz, DMSO- d_6): δ 7.30 (d, $J=16.4$ Hz, 1H, ArH), 7.52-7.60 (m, 4H, ArH), 7.75 (d, $J=8.4$ Hz, 2H, ArH), 7.89 (dd, $J=3.6$ Hz, $J=8.4$ Hz, 2H, ArH), 8.96 (d, $J=9.2$ Hz, 1H, ArH), 8.14 (d, $J=16$ Hz, 1H, ArH), 8.43 (d, $J=8.0$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 121.1, 123.6, 124.2, 126.2, 126.3, 126.4, 126.7, 128.5, 128.9, 129.3, 130.5, 131.2, 132.0, 133.8, 134.4, 137.0 ppm.

ST-314: ^1H NMR (400 MHz, DMSO- d_6): δ 7.25-7.38 (m, 2H, ArH), 7.53-7.63 (m, 6H, ArH), 7.88 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 121.5, 127.1, 127.2, 128.5, 129.0, 129.9, 130.2, 131.2, 131.9, 132.1, 136.2, 138.2 ppm.

ST-199: ^1H NMR (400 MHz, DMSO- d_6): δ 2.32 (s, 3H, -CH₃), 3.67 (s, 3H, -OCH₃), 3.83 (s, 6H, -OCH₃), 6.93 (s, 2H, -ArH), 7.08 (d, $J=7.6$ Hz, 1H, ArH), 7.17 (s, 2H, -ArH), 7.25 (t, $J=15.2$ Hz, 1H, ArH), 7.37 (d, $J=7.6$ Hz, 1H, ArH), 7.41 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 21.4, 56.2, 60.5, 104.2, 124.0, 127.2, 128.2, 128.6, 128.8, 129.0, 133.2, 137.4, 138.1, 153.4 ppm.

ST-160: ^1H NMR (400 MHz, DMSO- d_6): δ 3.70 (s, 3H, -OCH₃), 3.86 (s, 6H, -OCH₃), 6.14 (s, 2H, -CH₂), 6.97 (s, 2H, -ArH), 7.11 (d, $J=8$ Hz, 1H, ArH), 7.46 (d, $J=8$ Hz, 1H,

ArH), 7.57 (s, 1H, -ArH), 7.91 (s, 1H, -ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.5, 60.6, 102.3, 103.6, 107.9, 109.2, 126.1, 142.5, 148.2, 149.7, 153.6 ppm.

ST-488: ^1H NMR (400 MHz, DMSO- d_6): δ 3.68 (s, 3H, -OCH₃), 3.84 (s, 6H, -OCH₃), 6.93 (s, 2H, -CH₂), 7.78 (s, 1H, -ArH), 7.85 (d, J = 4 Hz, 2H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.3, 56.5, 60.4, 60.6, 102.9, 104.6, 119.0, 122.7, 122.9, 130.3, 135.4, 135.6, 138.0, 138.2, 153.6 ppm.

ST-527: ^1H NMR (400 MHz, DMSO- d_6): δ 3.81 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 7.07 (d, J = 4 Hz, 1H, ArH), 7.25 (d, J = 8.8 Hz, 1H, ArH), 7.34 (d, J = 16.2 Hz, 1H, ArH), 7.82 (d, J = 8.0 Hz, 1H, ArH), 7.92 (d, J = 4.0 Hz, 1H, ArH), 7.96 (s, 1H, -CH₂), 8.11 (d, J = 4 Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.0, 56.1, 108.9, 112.2, 112.5, 117.9, 119.8, 126.1, 128.8, 131.2, 131.5, 132.0, 132.7, 135.0, 137.9, 149.6, 150.7 ppm.

ST-526: ^1H NMR (400 MHz, DMSO- d_6): δ 7.59 (d, J = 8.8 Hz, 1H, ArH), 7.74-7.79 (m, 3H, ArH), 7.87 (d, J = 16.2 Hz, 2H, ArH), 7.97 (s, 1H, -CH₂) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 108.0, 116.9, 117.1, 117.7, 121.5, 125.0, 125.6, 126.4, 126.5, 129.2, 131.7, 135.1, 135.2, 136.0, 138.7, 156.3 ppm.

2.5 Synthesis of (*E*)-2,3-diaryl substituted acrylonitriles as anticancer agents.

Two (*E*)-2,3-diaryl substituted acrylonitriles (**Scheme 2.7**) were synthesized to compare their anti-cancer activities to the isomeric (*Z*)-2,3-diaryl substituted acrylonitriles.

Scheme 2.7 Synthesis of (*E*)-substituted diarylacrylonitrile analogs.

The (*E*)-substituted diarylacrylonitrile analogs **ST-510**, and **ST-507(A)** were obtained by refluxing their *Z*-isomer counterparts **ST-145**, and **ST-507** in methanol under ultraviolet light for 24 hrs. The reaction was monitored by GC-MS. Once the reaction was complete, it was cooled to room temperature and the precipitate that formed was filtered off to yield the desired (*E*)-substituted diarylacrylonitrile analogs **ST-510**, and **ST-507(A)** (Scheme 2.7).

ST-510: yellow solid; $^1\text{H NMR}$ (400 MHz, $\text{DMSO-}d_6$): δ 3.71 (s, 9H, $-\text{OCH}_3$), 3.75 (s, 3H, $-\text{OCH}_3$), 6.67 (s, 2H, $-\text{ArH}$), 6.72 (s, 1H, $-\text{ArH}$), 6.76 (d, $J = 8.4$ Hz, 1H, ArH), 6.86 (d, $J = 8.4$ Hz, 1H, ArH), 7.42 (s, 1H, ArH), 9.15 (s, 1H, $-\text{OH}$) ppm. $^{13}\text{C NMR}$ (100 MHz, $\text{DMSO-}d_6$): 55.86, 56.07, 56.35, 56.57, 60.53, 60.75, 106.20, 106.38, 110.00, 112.06, 116.65, 121.06, 123.51, 126.45, 128.59, 138.55, 144.67, 144.94, 146.46, 150.16, 153.92 ppm.

ST-507(A): brown solid; $^1\text{H NMR}$ (400 MHz, $\text{DMSO-}d_6$): δ 3.92 (s, 3H, $-\text{OCH}_3$), 3.96 (s, 6H, $-\text{OCH}_3$), 7.04 (t, $J = 13.2$ Hz, 2H, ArH), 7.12 (s, 1H, ArH), 7.22 (d, $J = 2, 8.4$ Hz, 1H, ArH), 7.31 (s, 1H, ArH), 7.35 (d, $J = 10.4$ Hz, 1H, ArH) ppm. $^{13}\text{C NMR}$ (100 MHz, $\text{DMSO-}d_6$): 55.95, 56.07, 108.69, 108.74, 109.18, 110.59, 110.61, 111.26, 115.06,

115.19, 118.44, 118.75, 122.02, 122.12, 127.47, 127.66, 140.15, 140.24, 145.66, 148.25, 149.23, 149.76 ppm.

2.6 Synthesis of (*E*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylic acid for evaluation of anticancer activity and for UDP-glucuronosyltransferase studies.

(*E*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylic acid was designed to investigate its ability to act as a substrate for UDP-glucuronosyltransferases and to evaluate the anticancer activity of the compound.

Scheme 2.8 Synthesis of (*E*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylic acid (**ST-12(a)**). (a) TEA, Ac₂O, 140 °C, 40% yield.

3-Hydroxy-4-methoxybenzaldehyde (**9**) (1.0 mmol), 2-(3,4,5-trimethoxyphenyl)acetic acid (**10**) (2.0 mmol) and triethylamine (3.2 mmol) were added to 5 mL of acetic anhydride. The resulting reaction mixture was refluxed at 140 °C for 4 h, with periodic monitoring by TLC. When the reaction was complete, 10 mL of ice-water was added and the mixture extracted with 10 mL of ethyl acetate. The organic phase was concentrated on a rotary evaporator and the desired product purified by silica gel flash column

chromatography using methanol/DCM as mobile phase to afford **ST-12(a)** in 35% yield (**Scheme 2.8**).

ST-12(a): ^1H NMR ($\text{CDCl}_3\text{-d}_6$, ppm): δ 3.43 (d, 12H, $-\text{OCH}_3$, $J = 15.2$ Hz), 6.69 (d, 2H, $-\text{ArH}$, $J = 2.8$ Hz), 6.54 (s, 1H, $-\text{ArH}$), 6.61 (s, 1H, $-\text{ArH}$), 6.80 (s, 1H, $-\text{ArH}$), 8.93 (s, 1H, $-\text{ArH}$), 12.41 (s, 1H, $-\text{COOH}$) ppm. ^{13}C NMR (CDCl_3): δ 55.9, 56.4, 60.6, 107.2, 110.0, 112.0, 118.0, 123.3, 127.4, 131.0, 132.5, 137.4, 139.5, 146.2, 149.3, 153.5, 169.0 ppm.

2.7 Synthesis of (*Z*)-5-(2-(2*H*-tetrazol-5-yl)-2-(3,4,5-trimethoxyphenyl)vinyl)-2-methoxyphenol (**ST-145(a)**) as second generation *trans*-stilbenes

Cushman and co-workers designed and synthesized a series of novel imidazole-containing resveratrol analogues and evaluated their inhibitory activities as aromatase and quinone reductase inhibitors. Among the synthesized compound **XC** (**Figure 2.7**) displayed potent aromatase inhibitory activity ($\text{IC}_{50} = 36$ nM) and showed promising anticancer activity against various human tumor cell lines (Sun, Hoshino et al. 2010). We planned to introduce a tetrazole ring resembling the imidazole pharmacophore present on **XC** as a structural modification of our lead compound (**ST-145**) to improve the compounds water solubility and anti-cancer activity. The pharmacological assay data for **ST-145(a)** is discussed in Chapter 3.

Figure 2.7 Structures of the potent aromatase inhibitor **XC**, **ST-145** and **ST-145(a)**.

(*Z*)-5-(2-(2*H*-tetrazol-5-yl)-2-(3,4,5-trimethoxyphenyl)vinyl)-2-methoxyphenol (**ST-145(a)**) was synthesized as a second generation analogue and a structural analogue of the lead molecule (*Z*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylonitrile (**ST-145**). Initially we tried to synthesize **ST-145(a)** by reacting (*Z*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylonitrile with $\text{NH}_4\text{Cl}/\text{NaN}_3$ in anhydrous DMF condition, but only traces of the final tetrazole product were formed. Subsequently, we used tributyltin chloride/ NaN_3 in DMF to afford (*Z*)-5-(2-(2*H*-tetrazol-5-yl)-2-(3,4,5-trimethoxyphenyl)vinyl)-2-methoxyphenol (**ST-145(a)**) in 58 % yield.

Scheme 2.9 Synthesis of **ST-145(a)**.

(a) A mixture of (*Z*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylonitrile (100mg; 1mmol), sodium azide (50mg; 5mmol) and ammonium chloride (42mg; 5mmol) was refluxed in 4ml of anhydrous DMF for 11 hrs. After the reaction was complete, 12ml of water was added and the resulting mixture was stirred for 10 min. The resulting aqueous solution was washed with five volumes of ethyl acetate three times, and the organic layers were combined and concentrated on a rotary evaporator. The residue was purified by DCM/methanol flash chromatography to yield (*Z*)-5-(2-(2*H*-tetrazol-5-yl)-2-(3,4,5-trimethoxyphenyl)vinyl)-2-methoxyphenol as a pale yellow solid in 5% yield. NOE experiments were carried out to confirm the structure of the *Z*-isomer product (**Figures 8.7, 8.8 and 8.9**).

(b) Tributyltin chloride (9.76 g, 0.03 mole) and sodium azide (1.95 g, 0.03) were stirred for 30 min at 15-30° C. *N,N*-dimethylformamide (1.46 g, 0.02 mole) was added and the

mixture stirred for 30 min. Thereafter, (Z)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylo nitrile (3.21 g; 0.01 mol) was added followed by o-xylene (5 ml). The reaction mass was heated to 130-135° C and stirred for until completion of the reaction (TLC monitoring). The reaction mixture was then cooled to 20° C, and o-xylene (10 ml) and methylene chloride (10 ml) were added followed by water (10 ml). Hydrochloric acid (2.0 g, 35% w/w) was then slowly added at 20-25° C over 30 min and the slurry obtained was stirred for 60 min. The resulting solid was filtered off, washed with methylene chloride (5 ml) and dried to afford the desired tetrazole product as a pale yellow powder (58% yield).

ST-145 (a): ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.89 (s, 3H, -OCH₃), 3.93 (s, 6H, -OCH₃), 3.97 (s, 3H, -OCH₃), 6.85 (s, 2H, ArH), 6.92-6.94 (d, *J* = 8.4 Hz, 1H, ArH), 7.34 (s, 1H, ArH), 7.48-7.50(d, *J* = 10.8 Hz, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆): 56.01, 56.28, 60.99, 103.10, 103.18, 109.26, 110.62, 115.08, 118.36, 122.34, 127.20, 130.49, 138.76, 141.48, 145.61, 148.44, 153.52 ppm.

Chapter 3

Anticancer activities of synthesized resveratrol analogs

3.1 NCI-60 Human Tumor Cell Line Screen

The biological evaluation of potential anticancer agents at the NCI is a two-stage process, starting with the screening of the submitted compounds against a panel of 60 human tumor cell lines at a single dose of 10 μ M. The results from the single dose is reported as a mean graph and is analyzed by the algorithm software, COMPARE. The software is used for comparing the anticancer activity of various molecules at a same time. Using this software, compounds which showed promising growth inhibitory activity at 10 μ M are then evaluated against the 60 cell panel at five concentration levels, viz. 10^{-4} M, 10^{-5} M, 10^{-6} M, 10^{-7} M and 10^{-8} M.

3.2 Methodology used for the *in vitro* anticancer screen at the NCI

RPMI 1640 medium with 5% fetal bovine serum and 2 mM L-glutamine is used for growing the NCI-60 human tumor cells. Initially the tumor cells are inoculated into 96-well microtiter plates in 100 microliters at plating densities starting from 5,000 to 40,000 cells/well. The range is dependent on the doubling time of individual tumor cell lines. The plates are then incubated at 37° C for 24 hours prior to addition of the submitted compounds (Shoemaker 2006).

After 24 hrs, two microtiter plates of each tumor cell line are fixed *in situ* with TCA. The optical density reading at this point represent the cell population for each tumor cell line at the time of compound addition (OD_{zero}). The experimental compounds are dissolved in DMSO at 400-fold concentration to the desired final maximum test concentration, and frozen. Then, an aliquot part of the frozen concentrate is thawed and diluted to twice the chosen maximum test concentration with medium containing 50 µg/ml gentamicin. Four more 10-fold serial dilutions are prepared to afford a total of five drug concentrations. A control sample with just DMSO is also prepared. Aliquots of 100 microliters of these different experimental drug dilutions controls are added to the appropriate microtiter wells containing 100 µl of medium, resulting in the required final drug concentrations, viz. 10⁻⁴ M, 10⁻⁵ M, 10⁻⁶ M, 10⁻⁷ M and 10⁻⁸ M and 0 M (control).

Once the compounds are added, the microtiter plates are incubated for 48 hrs at 37°C and 100 % relative humidity. Cold TCA is used to terminate the assay for adherent cells. Cells are fixed by the addition of 50 µl of cold 50 % (w/v) TCA and further incubated for 1 hr at 4°C. The supernatant is thrown away, and the microtiter plates are splashed five times with water and air dried. Sulforhodamine B (SRB) solution (100 microliters) at 0.4 % (w/v) in 1 % CH₃COOH is added to each well, and plates are incubated for another 10 minutes at room temperature. After SRB staining, free SRB is removed by washing five times with 1 % acetic acid. Bound SRB stain is successively dissolved with 10 mM trizma base, and the optical density is measured at a wavelength of 515 nm. The growth inhibitory or cytotoxicity effect of the test compounds in the above cellular assay is measured by determining percentage cell growth (PG) inhibition. Optical density (OD) measurements of SRB-derived color just before exposing the cells to the test compound

(OD_{zero}) and after 48hrs exposure to the test compound (OD_{test}) or the control vehicle (OD_{ctrl}) are recorded.

Growth percentage is calculated utilizing one of the two formulas below (Madadi, Penthala et al. 2014).

A negative growth percentage implies cytotoxicity.

If $(OD_{test} - OD_{zero}) \geq 0$, then

$$PG = 100 - (OD_{test} - OD_{zero}) / (OD_{ctrl} - OD_{zero})$$

and percentage growth is shown as positive.

If $(OD_{test} - OD_{zero}) < 0$, then

$$PG = 100 - (OD_{test} - OD_{zero}) / OD_{zero}$$
 and

percentage growth is shown as negative, which implies cell death.

Growth inhibitory or cytotoxicity effects of the test compounds are represented with three dose response parameters. They are:

1. **GI₅₀**: 50% growth inhibition, indicating concentration of drug resulting in a 50% reduction in net protein increase compared with control cells.
2. **TGI**: 100% growth inhibition, indicating concentration of drug resulting in a 100% reduction in net protein increase compared with control cells.
3. **LC₅₀**: lethal concentration, indicating concentration of drug lethal to 50% of cells.

3.3 Anticancer activity of simple stilbenes as resveratrol analogues

A total of 74 stilbenes analogues were synthesized (**Table 2.1**) and submitted to the NCI for screening against the panel of 60 human tumor cell lines, 22 analogs were selected for single dose screening at 10 μ M concentration. The single dose results with 10 μ M concentration are presented in the appendix section (**Table 8.1- Table 8.8**). From the 22 compounds selected for single dose screening, one compound (**ST-198**) showed promising anticancer activity and was selected for full five dose study. Of interest, Gossiau *et al.* also reported that **ST-198** potently inhibits the proliferation of cancer cells, with no inhibitory effect on normal cells (Gossiau, Pabbaraja et al. 2008). These results imply that for the stilbene to be active in the anticancer screens the trimethoxy substitution pattern on ring A and the *p*-methoxy group on ring B are essential structural elements. The GI₅₀ and TGI values of compound **ST-198** against the panel of 60 human cancer cell lines are presented in **Table 3.1**. Interestingly, the introduction a cyano group on the stilbene double bond next to ring A (**ST-148**) dramatically improved the mean GI₅₀ value against the panel of NCI 60 tumor cells from μ M range to nM range and the data is presented in **Table 3.4**.

Figure 3.1 Structures of **ST-198** and **ST-148**.

Table 3.1 Growth inhibition ($GI_{50}/\mu\text{M}$) and Total Growth Inhibition ($TGI/\mu\text{M}$) data for compound **ST-198** against human cancer cells.

3.4 Anticancer evaluation of (*E*)-3,5,4'-trimethoxy resveratrol analogues with substitutions at the C2 position on the stilbene.

Initially, analogs **RES-09**, **RES-10**, **RES-14**, **RES-27**, **RES-13**, **RES-16**, **RES-23** and **RES-18** were evaluated for their anti-proliferative activity against MCF-7 and MDA-231 breast cancer cell lines, and A549 and H460 lung cancer cell lines in the laboratory of Dr. Chendil Damadaran at the University of Kentucky, College of Medicine.

MCF-7, MDA-231, A-549 and H-460 cancer cells lines were purchased from the American Type Culture Collection (ATCC) (Manassas, VA) and were utilized to test the antitumor activity of the above C2-substituted resveratrol analogs. Breast cancer cell lines, MCF-7 and MDA-231 were grown in DMEM medium supplemented with 10% fetal bovine serum (FBS) and 1% L-glutamine, whereas lung cancer cell lines A549 and H460 were maintained and propagated in RPMI 1640 medium containing 2 μ M L-glutamine, 4.5 g/L glucose, 10 μ M HEPES, 1.0 μ M sodium pyruvate and 10% FBS. All cell cultures were maintained at 37°C in a 5% CO₂/95% air-humidified atmosphere. Anti-cancer activity of the resveratrol derived analogs **RES-09**, **RES-10**, **RES-14**, **RES-27**,

RES-13, RES-16, RES-23 and **RES-18** were assessed in cell viability assays (trypan blue dye exclusion) on both breast (MCF-7 and MDA-231) and lung (A-549 and H-460) cancer cells at 24 hours post-treatment at 5 concentrations of drug (1, 5, 10, 20 and 40 μM) and with vehicle (DMSO) alone. All assays were performed in triplicate. Results were expressed as percentage growth inhibition compared to control values. IC_{50} values for growth inhibition were derived from a nonlinear regression model based on sigmoidal dose-response curves and computed using GraphPad Prism 5 (Graphpad) (Koduru, Sowmyalakshmi et al. 2009).

Table 3.2. Trypan blue assay results; IC_{50} values (μM) for resveratrol analogs (**RES-09, RES-10, RES-14, RES-27, RES-13, RES-16, RES-23** and **RES-18**) against lung and breast cancer cell lines

Entry	Lung cancer cell lines		Breast cancer cell lines	
	A-549	H-460	MCF-7	MDA-231
RES-09	10.6	13.3	11.8	5.57
RES-10	29.2	25.2	>40	7.59
RES-14	33.4	37.0	7.93	4.24
RES-27	6.19	1.20	14.8	0.99
RES-13	3.05	7.40	2.40	10.3
RES-16	7.52	19.3	3.96	10.1
RES-23	9.20	28.0	1.99	4.09
RES-18	7.34	24.0	1.28	12.3

We initially evaluated the abilities of the resveratrol analogues to inhibit the growth of the two human lung cancer cell lines A-549 and H-460 (**Table 3.2**). All eight compounds exhibited IC_{50} values < 37 μM in both cancer cell lines, and generally showed less growth inhibition against A549 lung cancer cells than H460 lung cancer cells. The

analogs were also tested for their anti-proliferative activity against estrogen positive MCF-7 and estrogen negative MDA-231 breast cancer cell lines. All the compounds showed growth inhibition against MCF-7 cell lines with IC₅₀ values ranging from 0.99 μM to >40 μM. The pseudothiohydantoin analog (**RES-16**, IC₅₀ = 2.61 μM) and the thiohydantoin analog (**RES-13**, IC₅₀ = 3.05 μM) were identified as the most potent cytotoxic agents against A-549 lung cancer cells, whereas the creatinine analog (**RES-27**, IC₅₀ = 1.2 μM) and thiohydantoin analog (**RES-13**, IC₅₀ = 7.4 μM) were identified as the most potent cytotoxic agents against H460 lung cancer cells. The isobarbiturate analog (**RES-17**, IC₅₀ = 1.28 μM) and the isorhodanine analog (**RES-18**, IC₅₀ = 1.99 μM) were identified as potent cytotoxic agents against MCF-7 cells. The thiohydantoin analog (**RES-13**, IC₅₀ = 2.4 μM) and the pseudothiohydantoin analog (**RES-16**, IC₅₀ = 3.86 μM) also exhibited promising cytotoxicity against MCF-7 cells. The creatinine analog (**RES-27**, IC₅₀ = 0.99 μM) and the isorhodanine analog (**RES-18**, IC₅₀ = 4.09 μM) were identified as the most potent cytotoxic agents against MDA-231 cells.

From the library of resveratrol analogs synthesized, the following compounds: (*Z*)-2-amino-5-(2, 4-dimethoxy-6-(4-methoxystyryl)benzylidene) 1-methyl-1*H*-imidazol-4(*5H*)-one (**RES-27**), (*Z*)-2-amino-5-(2,4-dimethoxy-6-(4-methoxystyryl)benzylidene)thiazol-4(*5H*)-one (**RES-16**), (*Z*)-6-(2,4-dimethoxy-6-(4-methoxystyryl)benzylidene) dihydropyrimidine-2,4,5(*3H*)-trione (**RES-17**) and (*Z*)-5-(2,4-dimethoxy-6-(4-methoxystyryl) benzylidene)-4-thioxothiazolidin-2-one (**RES-18**) were identified as potent anti-proliferative agents against both lung and breast cancer cell lines.

Encouraged by the above results, a total of 31 resveratrol analogues with substitutions at the C2 position of the stilbene skeleton were submitted to NCI for evaluation in their cytotoxicity screening assays against 60 human tumor cell lines. The analogues **RES-11**, **RES-17**, **RES-59**, **ST-100** and **ST-127** showed good activity in the 10 μ M single dose screen, and were selected for five dose response studies for their *in vitro* cytotoxic effects on growth parameters against the 60 tumor cell line panel. Dose response curves were created by plotting cytotoxic effect against the log₁₀ of the concentration for each cell line. The compound's cytotoxic effects were determined as their GI₅₀, TGI and LC₅₀ values, which are presented in **Table 3.3**.

Among the compounds selected for five dose testing, acrylonitrile analogs **ST-100** and **ST-127** were found to be very effective against five particular human cancer cell lines; i.e. SR, NCI-H522, SF-539, MDA-MB-435 and RXF 393, with GI₅₀ values that were less than 300 nM. Lung cancer cell line NCI-H522 appeared to be the most sensitive to the growth inhibition effects of **ST-100** and **ST-127**, exhibiting GI₅₀ values of 240 nM and 250 nM, respectively. Compounds **ST-100** and **ST-127** also exhibited impressive growth inhibition against melanoma cancer cell line MDA-MB-435 with GI₅₀ values of 240 nM and 280 nM, respectively. Importantly, compound **ST-100** showed promising growth inhibitory activity affording GI₅₀ values < 1 μ M for more than 50% of the human tumor cell lines in the panel. Compound **ST-127** was also effective against CNS cancer cell lines SF-295 (GI₅₀ = 360 nM) and SF-539 (GI₅₀ = 270 nM), renal cancer cell lines 786-0 (GI₅₀ = 380 nM), CAKI-1 (GI₅₀ = 500 nM), RXF 393 (GI₅₀ = 310 nM), and breast cancer cell line MCF-7 (GI₅₀ = 390 nM). Compound **ST-127** was also found to have an effective GI₅₀ value of 280 nM against leukemia cancer cell line SR.

Table 3.3: Growth inhibition (GI₅₀/μM) and cytotoxicity (LC₅₀/μM) data for compounds RES-11, RES-17, RES-59, ST-100 and ST-127 against human cancer cells.

In conclusion, a library of novel resveratrol analogs with different substitutions on the C2 position of the stilbene skeleton was synthesized and evaluated for their growth inhibition properties against a panel of 60 human cancer cell lines. The acrylonitrile analog **ST-100** was found to be the lead compound with GI₅₀ values < 1 μM for more than 50% of the cells in the panel. The novel acrylonitrile resveratrol analog **ST-100** represents a promising lead compound that may have clinical potential in treating a variety of solid and hematological cancers.

3.5 Anticancer activity of (*E/Z*)-2,3-diaryl substituted acrylonitriles as anticancer agents.

A total of 74 (*E/Z*)-2,3-diaryl substituted acrylonitriles were synthesized (Table DD) and submitted to the NCI for screening against the 60 human tumor cell panel, and 41 analogs were selected for single dose screening at 10μM. The single dose results are presented in the appendix (**Table 8.9- Table 8.14**). From the 41 compounds selected for single dose screening 18 compounds showed promising anticancer activity and were selected for full

five dose studies. The GI₅₀ and TGI values of these 18 compounds against the panel of 60 human cancer cell lines are presented in **Tables 3.4 to 3.8**

Table 3.4: Growth Inhibition (GI₅₀/μM) and Total Growth Inhibition (TGI/μM) data for compounds **ST-198, ST-148, ST-147 and ST-124** against human cancer cells.

From the 74 (*E/Z*)-2,3-diaryl substituted acrylonitriles that were synthesized, analogues **ST-145** and **ST-510** were found to be the lead compounds from the five-dose studies against the panel of 60 human cancer cell lines. These compounds were remarkable in that they afforded GI₅₀ values that were less than 10 nM against almost all human cancer cells in the NCI panel. Although, the GI₅₀ values of the two isomers **ST-145** and **ST-510** are comparable, the *Z* isomer, **ST-145**, had the best TGI (Total Growth Inhibition) profile against HL-60(TB), NCI-H522, SF-539, MDA-MB-435, A-498, MDA-MB-468 tumor cell lines with values less than 10 nM.

3.6 *In vitro* toxicity and tubulin affinity study of ST-145, ST-510, ST-507 and ST-507(a) against acute myeloid leukemia (AML) cell line MV-411

Compounds **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** were found to be very effective against the human leukemia sub-panel of cells, and especially the two analogs **ST-145** and **ST-510**, which had GI₅₀ values of less than 10 nM across all the leukemic cells in the subpanel. At this point, we decided to test the lead compounds **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** against acute myeloid leukemia MV-411 cells. The biological assays related to MV-411 cell lines were conducted by Dr. Monica Guzman's research group.

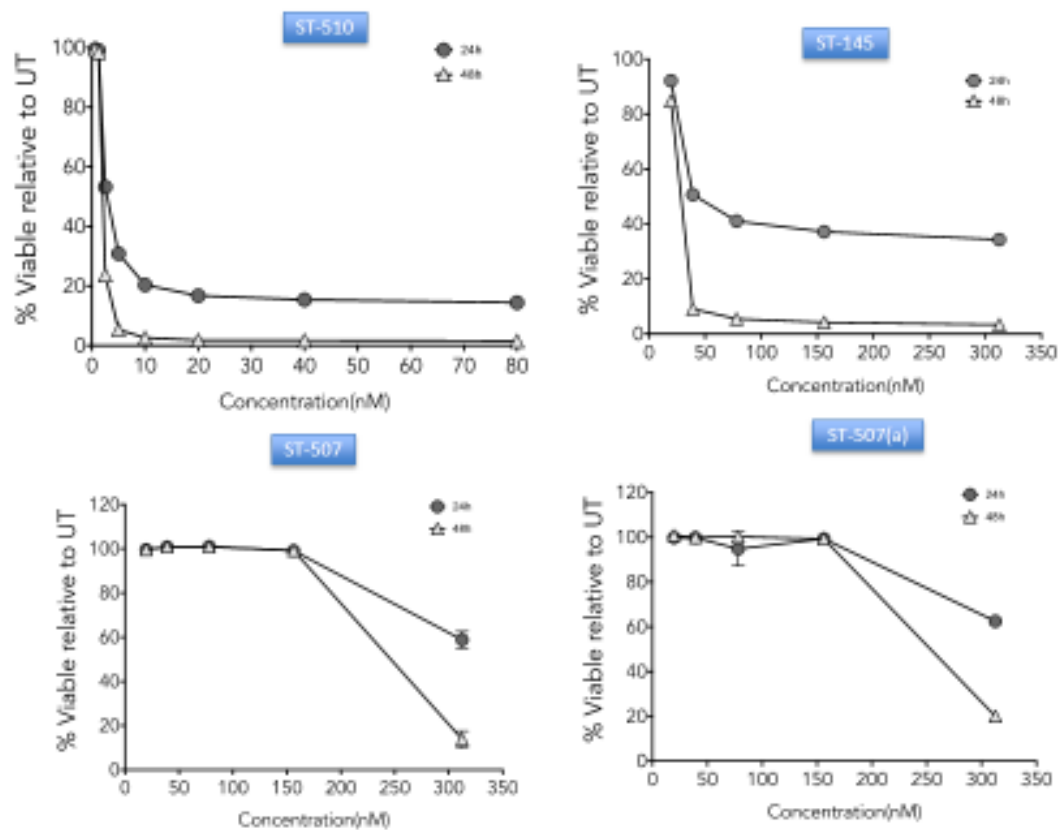

Figure 3.2. Lead compounds **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** exhibit potent anti-leukemia activity. MV-411 cells were treated with the indicated compounds for 24 and 48 h. Cell viability was determined by Annexin V staining. Percent viability was calculated as the percent of annexin v-/7-AAD-cells relative to control.

MV-411 cells (AML cell line) were treated with increasing concentrations of the lead compounds **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** for 24 and 48 hours. **Figure 3.2** shows the dose-response curves for each of the compounds at both time courses. We found that **ST-510** was the most potent anti-leukemia compound in the series, causing more than 80 percent cell death over both 24h and 48h drug treatments at concentrations below 5 nM (Figure 3.2 top left panel). Compound **ST-145** afforded an LD₅₀ of ~30nM over 48 hours of drug treatment (Figure 3.2). Compounds **ST-507** and **ST-507(a)**

presented LD₅₀ values of ~238nM and ~280nM, respectively, at 48h (**Figure 3.2**). These data suggest that further investigation into the value of the above analogues as possible treatment for AML and associated leukemias is warranted, and may provide novel therapeutic avenues for treating this hematological malignancy.

Figure 3.3: Structures of the lead cyano stilbenes **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** tested against MV-411 (AML) cells.

We wanted to test our hypothesis that the mode of action of the cyano stilbene analogues as anticancer agents was through disruption of microtubule dynamics, resulting in the inhibition of mitosis. We investigated whether our lead compounds **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** could interfere with microtubule polymerization by immunofluorescence using antibody against tyrosinated tubulin (a marker for dynamic microtubules) (Gundersen, Kalnoski et al. 1984, Baas and Black 1990). Through this study we also wanted to compare depolymerization activity in the presence of the *E/Z* cyano stilbenes.

MV4-11 cells were treated with the indicated doses (25, 50 and 100 nM) of **ST-507**, **ST-507(a)**, **ST-145** and **ST-510** for 2 hrs. Intracellular staining was performed using antibody against tyrosinated α -tubulin. Cells were stained with DAPI before mounting to the slides to show the cell nucleus. Cells were lysed in microtubule stabilizing buffer. The polymerized α -tubulin in the pellets (P) and unpolymerized α -tubulin in the supernatants (S) were detected by Western blotting using antibody against tyrosinated α -tubulin.

Figure 3.4: Microtubule depolymerization assay with the lead compounds **ST-507**, **ST-507(a)**, **ST-145** and **ST-510**.

Consistent with the superior anti-leukemia activity observed for **ST-510** over **ST-145** in MV4-11 cells, **ST-510** demonstrated a more potent inhibition of MT polymerization when compared to **ST-145** (Figure 3.5). Thus, our data strongly demonstrates that all four *E/Z* diarylacrylonitriles bind to tubulin directly to inhibit its polymerization.

In conclusion a library of *E/Z* diarylacrylonitriles analogs resembling resveratrol were synthesized and evaluated for their anticancer activity in an NCI panel of 60 human tumor cell lines and the lead compounds from the study (i.e. **ST-507**, **ST-507(a)**, **ST-145** and **ST-510**) were tested against MV-411 (Acute Myeloid Leukemia) cells. Analogs **ST-**

145 and **ST-510** were found to have potent anticancer properties that are likely mediated through interference with tubulin polymerization. This data suggests that further investigation into the clinical potential of these analogues for treatment of AML could provide novel therapeutics for treatment of this hematological malignancy.

3.7 Anticancer activity of (Z)-5-(2-(2H-tetrazol-5-yl)-2-(3,4,5-trimethoxyphenyl)vinyl)-2-methoxyphenol (**ST-145(a)**) as a second generation *trans* stilbene analogue

From the library of synthesized resveratrol analogs, **ST-145** was found to a lead anticancer agent. However, we wanted to synthesize second generation drug-like molecule with improved water solubility while preserving the potency of **ST-145**. **ST-145(a)** is a tetrazole substituted stilbene and was prepared as a second generation anticancer molecule in the resveratrol series. The GI₅₀ TGI and LD₅₀ values of the **ST-145(a)** against the panel of NCI 60 human cancer cell line panel are presented in **Table 3.9**.

Table 3.9: Growth Inhibition (GI₅₀/μM), Total Growth Inhibition (TGI/μM) and Cytotoxicity (LC₅₀/μM) data for compound **ST-145(a)** against human cancer cells.

ST-145(a) was selected for full dose response studies had very effective GI_{50} and TGI (Total Growth Inhibition) values against various human tumor cell lines. The majority of the LD_{50} values were $>100\mu\text{M}$ against most of the human cancer cell lines, implying the compound is a potent anti-proliferative agent. **ST-145(a)** had impressive GI_{50} values of $<10\text{nM}$ against almost all the cell lines in the panel except for colon cancer cell lines HT29 and COLO 205. The compound also showed potent TGI values of $<10\text{nM}$ against non-small cell lung cancer cell line NCI-H522, CNS cancer cell line SF-539, Melanoma cell line MDA-MB-435 and renal cancer cell line A498.

3.8 *In vitro* toxicity study of ST-145(a) against Acute Myeloid Leukemia cell line MV-411

Figure 3.5. Lead compound ST-145(a) exhibited potent anti-leukemia activity against MV-411 cells.

MV-411 cells (AML cell line) were treated with increasing concentrations of the lead compound **ST-145(a)** for 48 hours. Cell viability was determined by Annexin V staining. Percent viability was calculated as the percent of annexin v-/7-AAD- cells relative to control. Compound **ST-145(a)** exhibited an LD₅₀ <40nM after 48 hours of drug treatment (Figure 3.5), and is worthy of further preclinical investigation as a possible treatment for AML. **ST-145(a)** may also have clinical potential in treating a variety of human cancers.

3.9 Conclusion

In conclusion, a large library of resveratrol analogs have been synthesized and evaluated for anticancer activity in the NCI panel of 60 human tumor cell lines. **Figure 3.6** illustrates the triage flow chart with the number of compounds submitted to the NCI (**180**) versus the number of compounds selected for 10 μ M single dose screening (**85**).

Out of **85** compounds screened, **25** showed promising growth inhibitory activity against human tumor cell lines and were selected for full dose-response study. The lead compounds emerging from these five-dose study were also tested for their tubulin binding activity and their cytotoxicity against MV-411 (Acute Myeloid Leukemia) cells was determined.

Figure 3.6: Triage flow chart of resveratrol analogues that were submitted for anticancer screening in the NCI panel of 60 human cancer cell lines.

Figure 3.7: Structures of the lead resveratrol analogs **ST-145(a)**, **ST-145** and **ST-510**.

Three lead compounds, **ST-145(a)**, **ST-145** and **ST-510** (**Figure 3.7**) that may have clinical potential in treating a variety of human cancers have been discovered that have potent anticancer properties. The mechanism of action of these compounds are likely mediated through their interference with tubulin polymerization. Further investigation of this important class of compounds may provide novel therapeutic agents with clinical potential.

Chapter 4

Preparation of novel 4,5 disubstituted-2*H*-1,2,3-triazoles as combretastatin A4 analogues

4.1 Introduction

Although, significant research has been carried out to date to treat cancer, there is still a lack of effective chemotherapeutic treatment to cure it completely with minimal side effects. Also, considerable effort has been put into identifying molecules with anti-cancer properties from both natural and synthetic sources. More than 60% of the anticancer drugs currently available are from natural sources (Gordaliza 2007). The search for potent semi-synthetically derived anticancer agents from parent natural products continues to be an important part of the drug discovery process.

Antimitotic agents are a major class of cytotoxic drugs for the treatment of cancer, and drugs that target microtubule/tubulin dynamics are widely used in cancer chemotherapy (Jordan 2002). There are three major binding sites for tubulin. They are the vinca, taxane and colchicine domains. The vinca alkaloids such as vincristine and vinblastine, bind to the vinca domain and inhibit the assembly of microtubule structures and arrest mitosis (Hadfield, Ducki et al. 2003). Paclitaxel acts at the taxane domain and stabilizes microtubules interfering with the normal breakdown of microtubules during mitosis (Jordan and Wilson 2004). Our area of interest was the colchicine binding site. Colchicine binds to tubulin and inhibits microtubule polymerization. Anti-mitotic agents

such as combretastatin A-4 (CA-4) and related compounds have the capability of binding at the colchicine domain of tubulin. These natural products are structurally related to resveratrol and have received much attention lately, since the water-soluble phosphate salt of CA-4 is currently in phase III clinical trials for treatment of anaplastic thyroid cancer. The phosphate salt of CA-4 is also in phase II clinical trials as a treatment for polypoidal choroidal vasculopathy and neovascular age-related macular degeneration (Young and Chaplin 2004, Cooney, Ortiz et al. 2005).

Combretastatin A4 (CA-4) is a *cis*-stilbene compound originating from the South African willow tree, *combretum caffrum*. CA-4 functions as a microtubule targeting agent, interfering with microtubule dynamics and perturbing the mitotic cycle (Tron, Pirali et al. 2006). When compared to colchicine, the vascular disrupting effects of CA-4 are well below the maximum tolerable dose with fewer side effects *in vivo* (Tozer, Kanthou et al. 2002). However, CA-4 suffers from chemical stability issues because of facile *cis-trans* isomerism in solution. CA-4 is a *cis*-configured stilbene which is readily converted to the thermodynamically more stable, but less potent *trans*-isomer (Hsieh, Liou et al. 2005). Extensive studies have been conducted in attempts to stabilize the *cis*-configuration of CA-4 by replacing the ethylene bridge in the molecule with heterocyclic ring systems such as β -lactam, azetidone, thiazole, tetrazole, imidazole, pyrazole, oxazolone, triazole, furanone moieties (Shirai, Takayama et al. 1998, Tron, Pagliai et al. 2005, Carr, Greene et al. 2010, Beale, Bond et al. 2012, Banimustafa, Kheirollahi et al. 2013, Demchuk, Samet et al. 2014).

Figure 4.1: Structures of Combretastatin A4 (CA-4) (A), Colchicine (B), and heterocyclic anti-tubulin compounds (C-I).

In the work described herein, we report on the synthesis of novel and potent *cis*-constrained 4,5-disubstituted 2*H*-1,2,3-triazole combretastatin A-4 analogs which incorporates a unique heterocyclic moiety between the two aromatic rings to afford a chemically stable, *cis*-configured CA-4 scaffold. Evaluation of the anti-cancer properties of a sub-library of these novel CA-4 analogues against the NCI panel of 60 human tumor cell lines has been performed, as well as with the determination of activity of these compounds in the tubulin polymerization assay.

4.2 Methodology, Development, and Design of 4,5 disubstituted-2H-1,2,3-triazoles

1,2,3-Triazoles are an important class of heterocycles which have a wide range of applications in agricultural, industrial and pharmaceutical arenas. This ring system is present in a number of drugs with various biological properties, such as anti-cancer, anti-fungal, anti-viral, anti-consulvant (Pålhagen, Canger et al. 2001), and anti-HIV agents (Alvarez, Velazquez et al. 1994). Industrial applications include dyes, photostabilizers, photographic materials and anti-corrosives. Our laboratory is currently focusing on the development of anticancer agents structurally related to resveratrol and combretastatin A4 (CA-4) (Figure 4.1, A) (Pettit, Singh et al. 1995, Penthala, Janganati et al. 2014). CA-4 suffers from chemical instability in solution, due to *cis-trans* isomerism (Nathwani, Hughes et al. 2013). We are currently involved in identifying chemically stable analogues of *cis*-cyano-CA4 and related compounds that retain their potent anticancer properties. One approach we are exploring is the replacement of the acrylonitrile moiety in these active anticancer agents with a heterocyclic ring system such as the triazole moiety, to afford geometrically stable triazole analogs of cyano-CA4 (Figure 4.2, C) that do not undergo *cis-trans* isomerism in solution.

Figure 4.2: Structures of CA4 and *cis* constrained heterocyclic CA4 analogs.

The conventional route for preparing 1,2,3-triazoles is via the Huisgen 1,3-dipolar cycloaddition of azides with alkynes (**Scheme 4.1**). However, the disadvantages of this synthetic approach are poor regioselectivity and long reaction times. A variety of triazoles can also be synthesized by the click chemistry methodologies developed by Sharpless et al. between azides and alkynes, to yield 1,5-disubstituted 1,2,3-triazoles (Kraśiński, Fokin et al. 2004). However, inorganic azides (e.g. NaN_3) are not good substrates for this reaction, and these methods cannot be applied to the synthesis of internal alkynes. Recently, Majireck et al. and Tsai et al. have reported the synthesis of 4,5-disubstituted *2H*-1,2,3-triazoles by cycloaddition of internal alkynes with alkyl azides or metal azides, but the disadvantage of this approach is the low yielding synthesis of the alkyne reactant, especially when an electron donating group is attached to the alkyne terminus (Majireck and Weinreb 2006, Tsai, Yang et al. 2009).

Scheme 4.1: 1,2,3 triazole synthesis by the Huisgen azide-alkyne 1,3 dipolar cyclization.

A less explored route for the synthesis of *2H*-1,2,3-triazoles is the cycloaddition of azides with alkenes bearing a good leaving group. Zard et al. reported the synthesis of 4,5-disubstituted-1*H*-1,2,3-triazoles from nitroalkenes, but did not report any formation of 4,5-disubstituted *2H*-1,2,3-triazoles via this approach (Quiclet-Sire and Zard 2005). Sengupta et al. have reported the synthesis of 4,5-disubstituted *2H*-1,2,3-triazoles from

nitroalkenes, however, the presence of a vinyl group was necessary for the reaction to proceed (Sengupta, Duan et al. 2008).

Herein, we report a novel synthetic procedure for the synthesis of 4,5-disubstituted 2*H*-1,2,3-triazoles from (*Z*)-2,3-diaryl-substituted acrylonitriles by treatment with NaN₃/NH₄Cl in aqueous DMF (**Scheme 4.3**). The advantage of this methodological approach is that cyano-CA4 analogs bearing a broad range of aromatic functionalities can be easily converted to their corresponding 2*H*-1,2,3-triazole derivatives in one step.

Utilizing (*Z*)-3-(3,4-dichlorophenyl)-2-(3,4-dimethoxyphenyl) acrylonitrile as a model reactant, it was observed that using a combination of 10:1 volumes of DMF/H₂O as solvent significantly improved the yield of 4-(3,4-dichlorophenyl)-5-(3,4-dimethoxyphenyl)-2*H*-1,2,3-triazole compared to using DMF alone (**Scheme 4.3**). The reaction did not proceed in anhydrous THF. The rate of the reaction was found to be dependent on the molar amount of NaN₃/NH₄Cl used (**Table 4.1**). The optimum conditions for this reaction are: heating the reactant under reflux with 3 molar equivalents of NH₄Cl and 3 molar equivalents of NaN₃ in 10:1 volumes of DMF/H₂O. X-ray crystallographic studies on compounds **ST-464** and **ST-447(a)** confirmed the presence of a 2*H*-1,2,3-triazole ring system and the position of *N*-methylation (**Figure 4.3**).

Scheme 4.2: Proposed mechanism and optimization of the reaction conditions for the synthesis of 4-(3,4-dichloro)-5-(3,4-dimethoxyphenyl)-2*H*-1,2,3-triazole and synthesis of its methylated product.

Table 4.1: Optimization of the reaction conditions for the synthesis of 4-(3,4-dichloro)-5-(3,4-dimethoxyphenyl)-2*H*-1,2,3-triazole .

Entry	Solvent	Reaction Conditions	Yield ^a (%)
1	DMF^c	Reflux, 5 hrs, 3 eq NH_4Cl / 3eq NaN_3	24
2	$\text{DMF}/\text{H}_2\text{O}^b$	Reflux, 5 hrs, 3 eq NH_4Cl / 3eq NaN_3	81
3	$\text{DMF}/\text{H}_2\text{O}^b$	Reflux, 5 hrs, 1 eq NH_4Cl / 1eq NaN_3	45
4	$\text{DMF}/\text{H}_2\text{O}^b$	Reflux, 5 hrs, 3eq NaN_3	32
5	THF^c	Reflux, 5 hrs, 3 eq NH_4Cl / 3eq NaN_3	0

Previous reports have not elaborated on the mechanism of formation of the 2*H*-1,2,3-triazole ring in stilbenes of structure **1a** (Scheme 4.3) (Majireck and Weinreb 2006, Tsai, Yang et al. 2009). The proposed mechanism of triazole ring formation likely involves

initial Michael addition of azide ion at the unsubstituted sp² olefinic carbon to afford compound **X** followed by cyclization to **Y** (**Scheme 4.2**). Acid-catalyzed elimination of the cyano moiety then affords **ST-447**. It is evident from the optimization studies that NH₄Cl and water are essential components in the reaction (**Table 4.1**). All the reactions were conducted with (*Z*)-2,3-diarylacrylonitriles. However, we did examine the relative usefulness of utilizing (*E*)-2,3-diarylacrylonitriles in these reactions. Thus, (*E*)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)-acrylonitrile, the corresponding (*E*)-isomer of **1e** (**Table 4.2**), was used as a starting material for the synthesis of compound **ST-145(b)**. The yield of the resulting 2*H*-1,2,3-triazole **ST-145(b)** was 21% compared to 59% when the (*Z*)-isomer was utilized under similar reaction conditions (**Table 4.2**; Entry 5), indicating that (*E*)-2,3-diarylacrylonitriles are less useful than their (*Z*)-counterparts in the synthesis of 2*H*-1,2,3-triazoles of structure **2** (**Scheme 4.3**). Also when (*E*)-1,3-dimethoxy-5-(4-methoxystyryl)benzene (**TMR**) was used as a starting material the reaction did not proceed (**Table 4.2**).

4.3 Chemistry

Scheme 4.3: Synthesis of 4,5-disubstituted 2*H*-1,2,3-triazoles from (*Z*)-2,3-diarylacrylonitriles.

General experimental procedure: A typical experimental procedure entailed refluxing a mixture of the (Z)-2,3-diarylacrylonitrile (**1**, **Scheme 4.3**), NaN₃ and NH₄Cl in a mole ratio of 1: 3: 3 in 10: 1 volumes of DMF/ H₂O for 5-12 hrs. The reaction was monitored by TLC and GC-MS. When the starting material had completely disappeared, cold water was added and the mixture was stirred over 10-15 min, during which time the final product precipitated out and could be filtered off. In the absence of a precipitate, the product was extracted into ethyl acetate, the organic extract washed with copious amounts of water, and the resulting organic liquor evaporated to dryness on a rotovaporator. The residue obtained was purified by flash column chromatography [need eluting solvent details] to afford the corresponding triazole (**2**, **Scheme 4.3**). Yields of the synthesized triazoles are presented in **Table 4.2**, and ranged from 59% to 87%.

A variety of cyano-CA4 analogs were subjected to treatment with NaN₃/DMF/H₂O under the above optimized reaction conditions, and their corresponding 4,5-disubstituted 2H-1,2,3-triazoles were obtained in modest to good yields (Table 2). No significant side products were formed in the reactions shown in **Scheme 4.4**.

Scheme 4.4: Synthesis of 4,5-disubstituted 2H-1,2,3-triazoles; reagents and conditions: (a) 5% NaOMe, MeOH, reflux. (b) NaN₃, NH₄Cl, DMF/H₂O.

HRMS (ESI): m/z calcd for C₁₄H₁₁N₄O₂ [M-H] 267.0882; found 267.0879.

ST-478: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.76 (s, 3H, $-\text{OCH}_3$), 7.03-7.04(d, $J=4.8$ Hz, 2H, ArH), 7.39-7.47 (m, $J=35.2$ Hz, 2H, ArH), 7.62-7.63(d, $J=1.6$ Hz, 1H, ArH), 7.71 (s, 2H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.51, 111.54, 121.21, 122.83, 129.17, 130.48, 131.29, 133.34, 133.42, 134.96, 156.51 ppm. HRMS (ESI): m/z calcd for $\text{C}_{15}\text{H}_{12}\text{Br}_2\text{N}_3\text{O}$ [M-H] 407.9347; found 407.9327.

ST-489: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.79 (s, 6H, $-\text{OCH}_3$), 3.91 (s, 3H, $-\text{OCH}_3$), 6.77 (s, 2H, ArH), 7.46 (s, 2H, ArH), 7.82 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 56.12, 56.23, 60.96, 61.05, 105.39, 105.45, 127.44, 129.88, 129.97, 130.53, 132.74, 132.84, 138.69, 153.53 ppm. HRMS (ESI): m/z calcd for $\text{C}_{17}\text{H}_{16}\text{Cl}_2\text{N}_3\text{O}_3$ [M-H] 380.0569; found 380.0564.

ST-492: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.47 (s, 6H, $-\text{OCH}_3$), 3.81 (s, 3H, $-\text{OCH}_3$), 6.65 (s, 2H, ArH), 7.50-7.52(t, $J=8$ Hz, 1H, ArH), 7.54-7.56(d, $J=4.4$ Hz, 1H, ArH), 7.76-7.77(t, $J=1.6$ Hz, 1H, ArH), 7.82-7.84(d, $J=8$ Hz, 1H, ArH), 8.27-8.29(d, $J=8.8$ Hz, 1H, ArH), 9.03-9.04(d, $J=4.4$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$): 55.70, 55.79, 0.85, 60.95, 104.47, 104.55, 122.68, 122.76, 124.69, 125.95, 126.66, 127.52, 129.42, 130.21, 138.21, 138.45, 148.15, 149.63, 149.69, 153.24 ppm. HRMS (ESI): m/z calcd for $\text{C}_{20}\text{H}_{19}\text{N}_4\text{O}_3$ [M-H] 363.1457; found 363.1460.

ST-491: ^1H NMR (400 MHz, $\text{DMSO-}d_6$): δ 3.82 (s, 3H, $-\text{OCH}_3$), 3.92 (s, 3H, $-\text{OCH}_3$), 6.87-6.89(d, $J=8$ Hz, 1H, ArH), 7.04-7.08(m, $J=14.4$ Hz, 2H, ArH), 7.42-

7.42(d, $J = 0.8$ Hz, 2H, ArH), 7.78 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.85, 55.95, 60.47, 111.19, 111.24, 121.00, 127.31, 129.78, 129.87, 130.49, 130.87, 132.41, 132.79, 149.09, 149.62, 171.36 ppm. HRMS (ESI): m/z calcd for $\text{C}_{16}\text{H}_{14}\text{Cl}_2\text{N}_3\text{O}_2$ [M-H] 350.0463; found 350.0465.

ST-482: Yellow solid; Yield %; ^1H NMR (400 MHz, DMSO- d_6): δ 3.77 (s, 6H, -OCH₃), 3.89 (s, 3H, -OCH₃), 4.26-4.29 (q, $J = 12.4$ Hz, 4H, ArH), 6.84 (s, 2H, ArH), 6.87-6.89 (d, $J = 8$ Hz, 1H, ArH), 7.04-7.05, 7.04-7.07 (dd, $J = 2$ Hz, 8 Hz, 1H, ArH), 7.15-7.16 (d, $J = 1.6$ Hz, 1H, ArH), 7.26 (s, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 55.99, 56.08, 60.90, 60.99, 64.27, 64.47, 105.24, 105.28, 117.42, 121.80, 138.18, 143.59, 144.09, 153.26 ppm. HRMS (ESI): m/z calcd for $\text{C}_{19}\text{H}_{20}\text{N}_3\text{O}_5$ [M-H] 370.1403; found 370.1398.

ST-497: Yellow solid; Yield %; ^1H NMR (400 MHz, DMSO- d_6): δ 3.78 (s, 6H, -OCH₃), 3.91 (s, 3H, -OCH₃), 7.08 (s, 2H, ArH), 7.54-7.58 (t, $J = 14.8$ Hz, 1H, ArH), 7.70-7.74 (t, $J = 14.8$ Hz, 1H, ArH), 7.82-7.83 (d, $J = 6.4$ Hz, 2H, ArH), 8.08-8.10 (d, $J = 8.8$ Hz, 1H, ArH), 8.16-8.18 (d, $J = 8.4$ Hz, 1H, ArH) ppm. ^{13}C NMR (100 MHz, DMSO- d_6): 56.08, 56.18, 60.92, 61.01, 106.21, 120.70, 125.57, 127.12, 127.56, 127.73, 127.68, 129.04, 130.20, 136.83, 138.50, 147.76, 153.19 ppm. HRMS (ESI): m/z calcd for $\text{C}_{20}\text{H}_{19}\text{N}_4\text{O}_3$ [M-H] 363.1457; found 363.1456.

ST-494: Yellow solid; Yield %; ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.73 (s, 3H, -OCH₃), 3.80 (s, 6H, -OCH₃), 6.83 (s, 2H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆):56.48, 56.67, 65.20, 106.29, 116.04, 116.84, 130.15, 139.13, 153.08 ppm.

ST-513: Yellow solid; Yield %; ¹H NMR (400 MHz, DMSO-*d*₆): δ 3.72 (s, 6H, -OCH₃), 5.29 (s, 1H, ArH), 6.73 (s, 2H, ArH), 6.83-6.85 (d, *J* =8.4 Hz, 1H, ArH), 7.42-7.44(d, *J* =8.8 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, DMSO-*d*₆):56.08, 56.18, 60.92, 61.01, 106.21, 120.70, 125.57, 127.12, 127.56, 127.73, 127.68, 129.04, 130.20, 136.83, 138.50, 147.76, 153.19 ppm.

A mixture of 5-(3,4-dichlorophenyl)-4-(3,4-dimethoxyphenyl)-2*H*-1,2,3-triazole (**ST-447**) (1 mmol), K₂CO₃ (10 mmol) and MeI (2 mmol) in 10 volumes of acetone was refluxed for 5 hrs. 2M aqueous HCl was then added to quench the reaction and the resulting mixture was evaporated to dryness on a rotavaporator. The resulting residue was dissolved in ethyl acetate, filtered, and the filtrate submitted to ethyl acetate/hexane flash column chromatography to yield 4-(3,4-dichlorophenyl)-5-(3,4-dimethoxyphenyl)-2-methyl-2*H*-1,2,3-triazole

(ST-447(a)): Pale yellow solid; ¹H NMR (400 MHz, CDCl₃-*d*): δ 3.83 (s, 3H, -OCH₃), 3.92 (s, 3H, -OCH₃), 4.25 (s, 3H, -CH₃), 6.86 (d, *J* =8 Hz, 1H, ArH), 7.05 (dd, *J* =15.2 Hz, 2H, ArH), , 7.42 (dd, *J* =16.8 Hz, 2H, ArH), 7.74 (d, *J* =1.6 Hz, 1H, ArH) ppm. ¹³C NMR (100 MHz, CDCl₃-*d*): 41.98, 56.08, 111.40, 121.07, 123.09, 127.45, 129.97, 130.59, 131.376, 132.41, 132.91, 141.99, 144.87, 149.25, 149.63 ppm.

Figure 4.3: X-ray Crystal structures of compounds **ST-464** and **ST-447(a)**.

4.5 Biological Evaluation

4.5.1 Anticancer activity of 2*H*-triazole analogs against a panel of NCI 60 human cancer cells

The sulforhodamine B (SRB) assay procedure described in **Chapter 3** was used to screen the synthesized 2*H*-triazole CA-4 analogues against the panel of 60 human tumor cell lines at the NCI (Rubinstein, Shoemaker et al. 1990). The growth inhibitory and cytotoxic properties of a tested compound in our present assay is measured by its percentage growth (PG) which is proportional to optical density (OD) of the tumor (Madadi, Penthala et al. 2014). Optical density (OD) measurements of SRB-derived color just

before exposing the cells to the test compound and after 48hrs exposure to the test compound or the control vehicle are recorded. All the synthesized CA-4 analogues were initially screened at a single dose (10^{-5} M) to determine growth inhibition properties. The NCI screening protocol requires 60% growth inhibition at 10^{-5} M in at least eight cell lines from the panel of 60 cell lines for the compounds to be selected for a complete dose-response study at five different concentrations, viz. 10^{-4} M, 10^{-5} M, 10^{-6} M, 10^{-7} M and 10^{-8} M.

Out of the submitted twenty three triazole derivatives, 12 analogues: **ST-124(a)**, **ST-440**, **ST-442**, **ST-452**, **ST-467**, **ST-471**, **ST-475**, **ST-482**, **ST-492**, **ST-497** and **ST-145(b)** were selected for single dose screening. The growth percentage values obtained from the initial single dose screens are represented in **Table 4.3** and **Table 4.4**.

Table 4.3: Percentage growth inhibition of NCI 60 human cancer cells by compounds **ST-124(a)**, **ST-440**, **ST-442**, **ST-447**, **ST-452** and **ST-467** at 10 μ M concentration.

4.5.2 Anticancer evaluation of ST-145(b) versus 9LSF rat gliosarcoma cells via colony formation assay

9LSF cells were acquired from the laboratory of Dennis Deen, Ph.D. (Brain Tumor Research Center, University of California, San Francisco). Cells were exposed to **ST-145(b)** at concentrations of 1 nM, 3 nM, 10 nM, 30 nM, 100 nM, 1 μ M, or 10 μ M for 24 hours prior to seeding of the colony formation assay. Cells were then trypsinized, counted, seeded into 25 cm² flasks, and incubated at 37°C to form colonies (Borrelli, Stafford et al. 1998). All conditions were seeded in triplicate. Flasks that were plated with less than 50,000 cells were previously plated with 50,000 lethally irradiated A549 cells to serve as feeders (Borrelli, Thompson et al. 1989). Flasks were removed from incubation when colonies were large enough to count (>50 cells). Colonies were then fixed and stained with crystal violet, rinsed, allowed to dry, and counted. LD₅₀ was determined as 7.5 nM using SigmaPlot **Figure 4.4**. The colony formation assay was conducted by Kevin Howk at Dr. Borelli's lab.

Figure 4.4: Dose response study of **ST-145(b)** against 9LSF cells.

4.6 Conclusion

In summary, we have developed a new facile procedure for the synthesis of 4,5-diaryl-2*H*-1,2,3-triazoles bearing a broad range of aryl moieties from their corresponding (*Z*)-2,3-diarylacrylonitriles. The method does not require an inert atmosphere, is economical, can be applied to a wide range of aryl groups and aromatic ring substitutions, and is a viable alternative to the Huisgen cycloaddition reaction of alkynes with azides.

The 2*H*-triazole CA-4 analogues do not undergo *cis-trans* isomerization and are stable in aqueous solution. They also have a better water-solubility profile compared to the parent CA-4 precursor molecules. With the exception of **ST-452**, all the compounds in this sublibrary had LC₅₀ values >100 μM against most of the human cancer cell lines in the NCI panel, implying that these compounds are anti-proliferative agents. It is noteworthy

that **ST-467** had impressive GI_{50} values of less than 10nM against almost all the cancer cell lines in the panel, except for melanoma cancer cell line UACC-62, and colon cancer cell lines COLO 205 and HCC-2998. **ST-467** also exhibited potent TGI values of <10nM against CNS cancer cell line SF-539, melanoma cell MDA-MB-435, ovarian cancer cell line OVCAR-3 and renal cancer cell line A498. Analogues **ST-124(a)** and **ST-282** exhibited GI_{50} values of <10nM against leukemia cancer cell lines K-562 and SR, non-small lung cancer cell line HOP-92, colon cancer cell lines HCT-116 and HCT-15, melanoma cancer lines M14 and UACC-62, ovarian cancer cell line NCI/ADR-RES and renal cancer cell line A498. Melanoma cancer cell line MDA-MB-435 and ovarian cancer cell line OVCAR-3 appeared to be the most sensitive to the growth inhibitory effects of **124(a)** and **ST-467**, exhibiting TGI values of <10 nM. Also, analogue **ST-145(b)** was very effective in the colony formation assay against 9LSF rat gliosarcoma cells, exhibiting an LD_{50} value of 7.5 nM.

Figure 4.5: Lead 4,5-diaryl-2H-1,2,3-triazoles as potent CA-4 analogs.

Thus, analogues **ST-467**, **ST-124(a)**, **ST-282** and **ST-145(b)** can be considered as lead anticancer agents from the 2H-triazole series of compounds and further investigation is warranted to determine their potential as clinically effective therapeutic agents.

Chapter 5

Resveratrol derivatives as selective, high affinity cannabinoid receptor ligands and correlation with their anti-cancer properties

5.1 Introduction

The psychotropic and therapeutic actions of cannabis extracts have been known for centuries. By 1940, the concerns about the danger of abuse has led to the banning of medical marijuana world-wide (Pisanti, Malfitano et al. 2009). However, increasing evidence of biologically beneficial aspects of cannabinoids associated with cancer, inflammation, obesity and brain damage is awakening renewed interest in cannabinoid receptor studies (Munson, Harris et al. 1975, Cridge and Rosengren 2013).

CB1 and CB2 receptors are the two major cannabinoid-specific receptors which have been characterized from mammalian tissues. CB1 receptors (CB1R) are abundantly expressed in the CNS (Pertwee 2006). These receptors are also expressed in peripheral nerve terminals and in many extra-neuronal sites. CB1R activation is responsible for most of the pharmacological effects of cannabinoids in the nervous system. In contrast, CB2 receptors (CB2R) are known to be expressed in other tissues, predominantly in cells of the immune system (Sarfaraz, Adhami et al. 2008). Interestingly, many types of cancer cells express relatively high densities of CB1 and CB2 receptors, and most recent studies report that cannabinoids can reduce tumor growth and progression in several animal models of cancer (Sanchez, de Ceballos et al. 2001, Sarfaraz, Adhami et al. 2008, Wasik, Christensson et al. 2011).

Cannabinoids can be classified into three structurally distinct groups: endocannabinoids, phytocannabinoids, and synthetic cannabinoids (Franks, Ford et al. 2014). Endocannabinoids are endogenous compounds synthesized in the body (example: Anandamide (**Figure 5.1**)). Phytocannabinoids are plant-derived compounds that are often structurally similar to Δ^9 -THC (**Figure 5.1**). Lastly, synthetic cannabinoids are compounds specifically designed with high affinity for CB1 and CB2 receptors to alter receptor and/or endocannabinoid function.

To develop cannabinoids with improved therapeutic properties, we synthesized of a novel class of cannabinoid receptor inhibitors, the indolequinuclidines (**Figure 5.1**) that bind with high nanomolar affinity to both types of cannabinoid receptors, and we have characterized the intrinsic activity of such compounds (Madadi, Penthala et al. 2013, Franks, Ford et al. 2014).

Figure 5.1 Structures of Anandamide, Tetrahydrocannabinol, *N*-benzyl indolequinuclidinones, Carboxamido-5-aryl-isoxazole.

Qamri and co-workers have demonstrated that synthetic cannabinoid receptor agonists JWH-133 and WIN-55 (**Figure 5.2**) inhibit cell proliferation against breast cancer cell lines (MDA-MB231, MDA-MB468). Interestingly, these results were reversed when breast cancer cells were treated with CB1R and CB2R antagonists AM 251 and SR 44528 (**Figure 5.2**), indicating the likely involvement of CB1 and CB2 receptors in tumor growth and metastasis (Qamri, Preet et al. 2009).

Figure 5.2 Structures of synthetic cannabinoids JWH-133, WIN 55, SR 144528 and AM252.

Recently, much attention has focused on potential chemotherapeutic uses for the naturally occurring plant stilbenoid, resveratrol, and resveratrol analogs such as the prenylated stilbenoids have been reported to have improved affinity for cannabinoid receptors

(Breits, Medina-Bolivar et al. 2012). In this regard, identifying selective and high affinity ligands for both CB1 and CB2 receptors is a worthwhile goal, since most cannabinoid drugs have been associated with potential addictive properties and other unwanted side effects due to their lack of selectivity.

Figure 5.3 Structures of prenylated stilbenoids *trans-arachidin-1* and *trans-arachidin-3*.

Based on the above mentioned literature review, we hypothesized that the anticancer activity of the synthesized resveratrol analogs may partly be mediated through their interaction with cannabinoid receptors. Thus, we wanted to find a correlation between cannabinoid receptor affinity and anticancer activity for our resveratrol derivatives. We initiated a study to identify selective CB1 and CB2 receptor ligands from the library of novel stilbene scaffolds structurally related to the resveratrol molecule. From our SAR studies we have discovered that incorporating a 3,4-methylenedioxy group into the phenyl moieties and introducing a cyano substituent onto the stilbene double bond not only improved affinity of these novel stilbenes for CB1 and CB2 cannabinoid receptors, but also afforded selectivity at CB1 and CB2 receptors.

5.2 Standard Operating Procedure for cannabinoid affinity screening

Membrane homogenates of either whole mouse brain (50 μg) (CB1R) or Chinese hamster ovary (CHO)-hCB2 cells (25 μg) (CB2R) were incubated for 90 min at room temperature with 0.2 nM [^3H]CP-55, 940, 5 mM MgCl_2 , and either increasing sample concentrations

(10 fM–10 μ M), 1 μ M WIN 55212-2 (to define non-specific binding) or vehicle (to determine total binding). Each ligand concentration was examined in duplicate, in a final volume of 1 mL of buffer containing 50 mM Tris, 0.05% bovine serum albumin (BSA) and 0.1% ethanol/0.1% dimethyl sulfoxide as vehicle. Reactions were terminated by rapid vacuum filtration through Whatman GF/B glass fiber filters, followed by five washes with ice-cold buffer (50 mM Tris, 0.05% BSA). Filters were immediately placed into 7 mL scintillation vials to which 4 mL of scintillation fluid was added. Bound radioactivity was determined after overnight incubation at room temperature by liquid scintillation spectrophotometry. Specific binding was expressed as total minus nonspecific binding and graphed for each data point as a percentage of specific binding occurring in the absence of any competitor. The affinity of IQDs for CB1Rs and CB2Rs was derived by employing the Cheng–Prusoff (Cheng and Prusoff 1973) equation to convert the observed IC₅₀ values to Ki values from 3 to 4 separate competition receptor binding curves for each ligand.

5.3 CB1 and CB2 receptor competitive binding data from screening assay with resveratrol analogs

Figure 5.4: Structures of **TMR**, **ST-124**, **ST-179**, **ST-165** and **ST-160**.

By comparing the CB1 and CB2 receptor competitive binding data for **TMR** and **ST-124** (**Figure 6.1**), it was found that incorporating a cyano group into the double bond of the stilbene moiety markedly improved the receptor affinity for both CB1 and CB2 receptors compared to the parent compound. Subsequently, a variety of cyanostilbenes were screened, and it was discovered that 3,4-methylenedioxy cyanostilbenes **ST-179**, **ST-165** and **ST-160** (**Figure 6.1**) not only exhibited improved receptor affinity but also afforded compounds that were selective ligands at both CB1 and CB2 receptors.

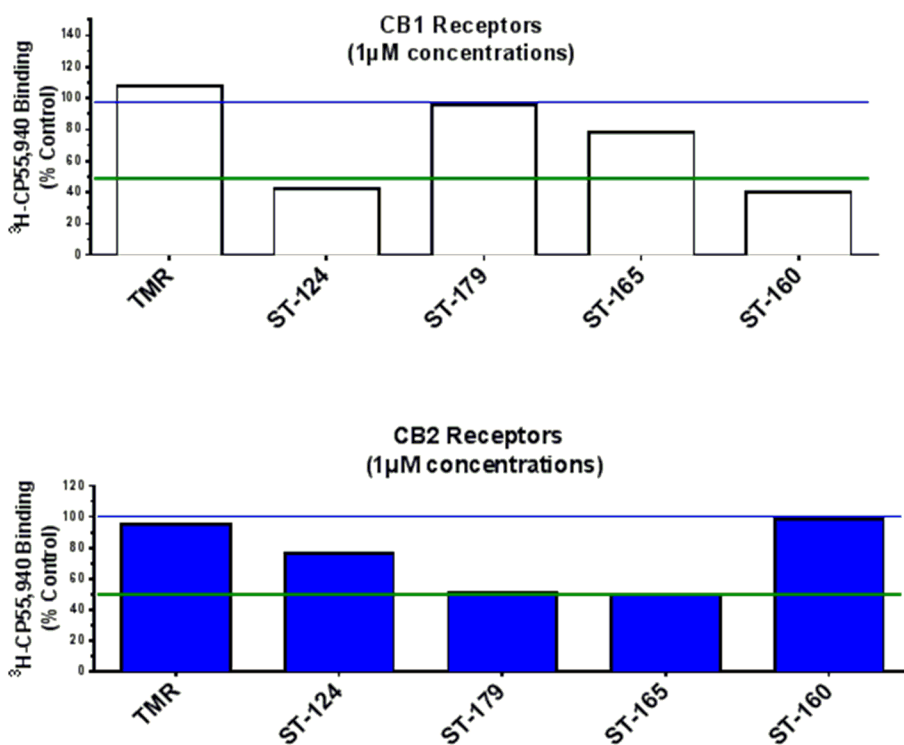

Figure 5.5: CB1 and CB2 competitive binding screen at 1µM concentration with **TMR**, **ST-124**, **ST-179**, **ST-165** and **ST-160**.

Initially, all twenty four 3,4-methylenedioxy cyanostilbenes synthesized were screened at 1 μ M in CB1 and CB2 competitive receptor binding studies, and several compounds showed promising affinities towards both CB1 and CB2 receptors (full screening results are given in the **Appendix; Figure 8.1-Figure 8.6**). However, only compounds with high affinity and/or selectivity were selected for subsequent evaluation utilizing complete binding curves to derive *K_i* values. Three compounds (**ST-179**, **ST-165** and **ST-160**) were identified as selective for CB1 and CB2 receptors with relatively high affinities (**Table 5.1** and **Figure 5.3**).

Table 5.1: *K_i* values for compounds **ST-179**, **ST-165**, and **ST-160** for CB1 and CB2 receptors.

Comp.	<i>K_i</i> values (nM)		CB1/CB2
	CB1	CB2	
ST-179	13290	284	47
ST-165	717	327	2
ST-160	400	780	0.5

Figure 5.6: Affinity (K_i) of compounds **ST-179**(A), **ST-165**(B) and **ST-160**(C) for mouse brain CB1Rs (mCB1) and human CB2Rs (hCB2).

5.4 Discussion and Conclusion

Twenty four novel 3,4-methylenedioxy substituted stilbene analogs were synthesized (**Chapter 2**). Several showed promising affinities in cannabinoid receptor binding assays, and some were selective for both CB1 and CB2 cannabinoid receptors. Two compounds were identified as selective receptor ligands. Compound **ST-179** had 47-fold selectivity for CB2 receptors ($K_i = 284$ nM) compared to CB1 receptors, while compound **ST-160** was 2-fold selective for CB1 receptors ($K_i = 400$ nM) compared to the CB2 receptors. Current studies are ongoing to determine the intrinsic activity of these high affinity cannabinoid ligands.

Compounds **ST-179** and **ST-165** were screened at a single dose (10^{-5} M) at NCI to determine their growth inhibition properties against various cancer cell lines. To our disappointment compound **ST-160** was not selected for single dose screening in the NCI panel of human cancer cell lines. Based on the single dose screening results, Compound **ST-179** was selected for full five dose response study against the NCI 60 cell panel of human tumor cell lines. The anticancer study results are presented in **Chapter 3**. Unfortunately, no direct correlation could be derived between the anticancer activity and the cannabinoid affinity results for **ST-179**, **ST-165** and **ST-160**. Thus, further studies need to be conducted on these resveratrol analogs to establish if any correlation between cannabinoid affinities and anticancer activities exists.

In conclusion, we have identified 3,4-methylenedioxy cyanostilbenes as a novel class of selective cannabinoid ligands that have the potential for development as novel cannabinoid therapeutics for treatment of obesity and/or drug dependency. The cannabinoid receptor activities of the molecules does not appear to correlate with their anticancer activities against human cancer cell lines.

Chapter 6

Summary

Herein, two medicinal chemistry projects related to the natural products resveratrol and combretastatin-A4, which possess anticancer properties, are presented. Resveratrol (3,5,4-trihydroxystilbene) is a well-known phytoalexin found in grapes, peanuts, red wine and other foods. It has been reported as a potential chemotherapeutic agent due to its striking inhibitory effects on cellular events associated with cancer initiation, promotion, and progression. However, resveratrol has some limitations which preclude its use in cancer treatment. It cannot be used as an antitumor drug due to its low bioavailability caused by rapid metabolism.

We have synthesized 184 compounds related to resveratrol with chemical alterations designed to make the molecule more potent and drug-like (presented in **Chapter 2**). Thus, the majority of the aromatic hydroxyl groups were defunctionalized by O-methylation and novel functional groups were added to the stilbene scaffold to improve anticancer potency. The resulting resveratrol analogs were divided into four groups based on the nature and position of the functional group introduced into the stilbene skeleton, i.e. simple stilbenes, C2-substituted stilbenes, cyanostilbenes and tetrazole stilbenes. All 184 resveratrol analogues were submitted to the NCI anticancer screening program and evaluated against a panel of 60 human tumor cells. Eighty five of these analogues were selected for single dose screening at 10 μ M concentration. NCI selects compounds based on drug-likeness of the structures analyzed by the algorithm software COMPARE, and does not accept compounds which have been previously submitted. From the 85

compounds selected for single dose screening, 25 resveratrol analogs showed promising anticancer activity and were selected for full five-dose studies. We have identified a tetrazole resveratrol analog **ST-145(a)** [(Z)-5-(2-(1H-tetrazol-5-yl)-2-(3,4,5-trimethoxyphenyl)vinyl)-2-methoxyphenol] as a lead anticancer agent from the resveratrol analog series. **ST-145(a)** had impressive GI₅₀ values of less than 10nM against almost all 60 cell lines in the NCI panel of human cancer cells, except for colon cancer cell lines HT29 and COLO 205. **ST-145** also showed potent TGI (Total Growth Inhibition) values of <10nM against Non-small cell lung cancer cell line NCI-H522, CNS cancer cell line SF-539, Melanoma cell line MDA-MB-435 and renal cancer cell line A498. The full anticancer activities of the synthesized resveratrol analogs are presented in **Chapter 3**.

In a separate study we aimed to test the hypothesis that the limited bioavailability of resveratrol, can be improved by synthesizing analogs which would be glucuronidated at a lower rate than resveratrol itself. From our library of resveratrol analogs we have selected three compounds (**ST-05**, **ST-12(a)** and **DNR-1**) hypothesizing that the functional moieties that were introduced into the molecule would slow the rate of glucuronidation and could constitute useful scaffolds for the subsequent design of resveratrol analogs with improved bioavailability. In the current study we demonstrated that **ST-05** [(E)-2,4-dimethoxy-6-(4-methoxystyryl)benzaldehyde oxime) and **ST-12(a)** [(E)-3-(3-hydroxy-4-methoxyphenyl)-2-(3,4,5-trimethoxyphenyl)acrylic acid] were substrates for recombinant UGT enzymes and human hepatic and intestinal microsomes. In conclusion, the glucuronidation of the novel stilbenoids studied in this study revealed that these compounds exhibit lower glucuronidation profiles when compared to resveratrol, and

likely represent useful scaffolds for the design of efficacious resveratrol analogs with improved bioavailability. The glucuronidation study results are discussed in **Data set 1** (Appendices).

Recently, resveratrol analogs such as prenylated stilbenoids have been reported to have improved affinity for cannabinoid receptors. In this regard, identifying selective and high affinity ligands for both CB1 and CB2 cannabinoid receptors is a worthwhile goal, since most cannabinoid drugs have been associated with potential addictive properties and other unwanted side effects due to their lack of selectivity. We initiated a new discovery program at UAMS to identify selective CB1 and CB2 receptor ligands from the library of novel stilbene scaffolds structurally related to the resveratrol molecule. Several of these compounds showed promising affinities in cannabinoid receptor binding assays, and some were selective for both CB1 and CB2 cannabinoid receptors. From the screened resveratrol analogs, two compounds were identified as selective CB2 and CB1 ligands, compound **ST-179** exhibited 47-fold selectivity for CB2 ($K_i = 284$ nM) compared to CB1 receptors. Compound **ST-160** was 2-fold selective for CB1 receptors ($K_i = 400$ nM) compared to the CB2 receptors. These structural analogs may have potential for the development as novel cannabinoid therapeutics for treatment of obesity and/or drug dependency. The cannabinoid receptor affinity studies with the stilbenes are presented in **Chapter 5**)

Combretastatin A4 (CA-4) is a *cis*-stilbene originating from the South African willow tree *Combretum caffrum*. It is one of the most potent antiangiogenic and antimitotic agents of natural origin. Its O-phosphate prodrug (CA-4P) is currently in phase 3 clinical

trial for the treatment of anaplastic thyroid cancer, and successfully retards tumor growth in wide spectrum of solid tumor models. However, recent studies have reported the chemical instability of CA-4 in solution due to *cis-trans* isomerization to the more thermodynamically stable, but less potent *trans*-CA-4 isomer. To circumvent this problem, introduced an aromatic triazole ring in place of the double bond of the *cis*-stilbene moiety of CA-4 to constrain molecule to the *cis*-configuration and to make molecule more stable more water-soluble. We have developed a facile procedure for the general synthesis of 4,5-diaryl-2*H*-1,2,3-triazoles as CA-4 analogs that incorporate a broad range of aryl moieties from their corresponding (*Z*)-2,3-diarylacrylonitriles. This method does not require an inert atmosphere, is economical, can be applied to a wide range of aryl groups and aromatic ring substitutions, and is a viable alternative to the Huisgen cycloaddition reaction of alkynes with azides. The methodology, development and design of these 4,5-disubstituted-2*H*-1,2,3-triazoles is discussed in **Chapter 4**.

A total of twenty three 4,5-diaryl-2*H*-1,2,3-triazoles as CA-4 analogs were synthesized and submitted to the NCI panel of 60 human tumor cells for anticancer screening. Of these, twelve analogs were selected for single dose screening at 10 μ M concentration. From the 12 compounds selected for single dose screening, six of these CA-4 analogs showed promising anticancer activity and were selected for full five dose-studies. From these CA-4 analogs, **ST-467** (4-(4-methoxyphenyl)-5-(3,4,5-trimethoxyphenyl)-2*H*-1,2,3-triazole) had impressive GI₅₀ values of less than 10nM against almost all the cell lines in the panel, except for melanoma cancer cell line UACC-62, and colon cancer cell lines COLO 205 and HCC-2998. Compound **ST-467** also showed potent TGI values of <10nM against CNS cancer cell line SF-539, melanoma cell line MDA-MB-435, ovarian

cancer cell line OVCAR-3, and renal cancer cell line A498. Also, compound **ST-145(b)** (2-methoxy-5-(5-(3,4,5-trimethoxyphenyl)-2*H*-1,2,3-triazol-4-yl)phenol), another triazole CA-4 analogue, was very effective in the colony formation assay against 9LSF rat gliosarcoma cells, exhibiting an LD₅₀ of 7.5 nM. Both **ST-467** and **ST-145(b)** can be considered as lead anticancer agents from the triazole CA-4 series and further investigation into their in vivo effects in various solid tumor xenograph models in nude mice may provide additional data on their potential as therapeutic agents for treatment of a variety of solid tumors. The anticancer activity results of the triazole CA4 analogs are presented in **Chapter 4**.

Novel Resveratrol-Based Substrates for Human Hepatic, Renal, and Intestinal UDP-Glucuronosyltransferases

7.1 Introduction

Resveratrol is a well-known, natural polyphenol known to be a potent antioxidant, coronary protective, hepatic protective, neuroprotective, cardiovascular protective, anti-inflammatory and anti-carcinogenic agent (Pace-Asciak, Rounova et al. 1996, Jang, Kang et al. 1999, Aggarwal, Bhardwaj et al. 2004, Kim, Zhu et al. 2006). Although initial preclinical data was encouraging, resveratrol could not be used as a drug because of its low bioavailability. Resveratrol was found to have a short half-life of 8-10 min after oral administration and was extensively metabolized to both O-sulfate and O-glucuronide conjugates (Marier, Vachon et al. 2002).

The human hepatic and intestinal UDP-glucuronosyltransferases (UGTs) actively transform resveratrol to its O-glucuronide conjugate (Sabolovic, Humbert et al. 2006). To circumvent this unfavorable metabolism of resveratrol, the search for resveratrol analogs with chemical stability, enhanced bioavailability and more promising metabolic stability, is of great importance.

Recently, Dr. Radomska's group at UAMS have discovered that prenylated resveratrol analogues, *trans*-arachidin-1 and *trans*-arachidin-3 (**Figure 7.1**) had O-glucuronidation rates that were slower in comparison to resveratrol (Brents, Medina-Bolivar et al. 2012). From our library of resveratrol analogs, three compounds were selected (**ST-05**, **ST-12(a)** and **DNR-1**, **Figure 5.1**) that were hypothesized to have a slow rate of O-glucuronidation and might represent a useful scaffold for the design of potent resveratrol analogs with improved bioavailability and which could be developed as chemotherapeutic agents with clinical potential. The glucuronate studies were carried out by members of Dr. Radomska's research group.

Figure 7.1: Structures of resveratrol analogs *trans*-arachidin-1, *trans*-arachidin-3, **ST-05**, **DNR-1** and **ST-12(a)**.

The three compounds selected for the study had the majority phenolic groups blocked by O-methylation or incorporated a hydroxylamine, carboxylic acid or aromatic nitro group on the stilbene scaffold.

The study was designed to elucidate:

1) If the above three chemically synthesized stilbene derivatives are substrates for human recombinant UGTs.

2) If the rate of glucuronidation of the three analogues was comparable to resveratrol itself.

Twelve major recombinant human UGT1A and UGT2B enzymes were utilized to determine their capability to metabolize these three resveratrol analogs. HPLC–UV–VIS analysis was used to identify the formation of glucuronide conjugates. LC–MS/MS and β -glucuronidase hydrolysis was used to elucidate the structures of the metabolites.

7.2 Source of Human Microsomes and Recombinant UGTs.

Human hepatic microsomes were acquired from ten contributors, and human intestinal microsomes were acquired from thirteen contributors. Recombinant proteins UGT1A1, 1A3, 1A4, and 1A6–1A10 were cloned and expressed in baculovirus-infected insect cells (Kurkela, Garcia-Horsman et al. 2003, Kuuranne, Kurkela et al. 2003). Human UGT2B4, 2B7, 2B15, and 2B17 were purchased from BD Biosciences (Woburn, MA) and the manufacturer's protocols were used to carry out the assays.

7.3 Screening of Human Microsomes and Recombinant UGTs

Screening trials for glucuronidation were conducted with human hepatic and intestinal microsomes from 10 and 13 donors, respectively, one pooled liver sample, and commercially available hepatosomes. A 250 μ L aliquot of substrate was dissolved in

ethanol solution and added to the incubation tube. The resveratrol analogs were sonicated to ensure solubilization. Reaction buffer and human microsomes (50 mg of total protein) or recombinant UGT membranes (5 mg of total protein) were then added. UDP-GlcUA in molar excess was added, and the samples containing the analogs were incubated at 37 °C for one hour. Final reaction concentrations were as follows: 100 μ M Tris-HCl (pH 7.4)/5 mM $MgCl_2$ /5 mM saccharolactone/2% DMSO/250 μ M substrate/2 micromolar UDPGA/50 or 5 μ g of total protein, respectively. The total reaction volume was 30 μ L. Controls were run under the same reaction conditions in the absence of substrate molecules. The glucuronidation rate with these enzymes has been shown to be linear for a maximum of 3 hours. The reactions were finally stopped by addition of 30 μ L of ethanol. Later, centrifugation of the samples was carried out at 14 000 rpm for 8 min to collect the protein. The supernatants were investigated by HPLC using an HP1050 HPLC system equipped with a UV-VIS diode array detector. Instrument function and data acquisition were assessed using Agilent ChemStation software.

7.4 Enzyme Kinetics Assays.

Kinetic parameters were calculated by incubating recombinant UGT protein with different concentrations of ST-12a (10–1000 μ M) or ST-05 (1–1000 μ M) with a molar excess of UDP-GlcUA for 1 hour. All kinetic assays were conducted in duplicate under conditions identical to those employed for screening assays.

7.5 Data Analysis.

Kinetic data analysis for the glucuronidation of ST-12(a) and ST-05 by UGTs were estimated by plotting the measured initial reaction velocity values as a function of substrate concentration. Graph-Pad Prism v4.0b (GraphPad Software, Inc., San Diego, CA) was utilized for conducting curve-fitting and statistical analyses. Kinetic constants were obtained by fitting the experimental data to the following kinetic models using the nonlinear regression (Curve Fit) function.

1. Michaelis–Menten (M–M) equation used for the one-enzyme model.

$$v = \frac{V_{max} \times [S]}{K_m + [S]}$$

2. Hill equation reflects the extent of cooperativity among multiple binding sites (Weiss 1997).

$$v = \frac{V_{max} \times [S]^n}{S_{50}^n + [S]^n}$$

3. Uncompetitive substrate inhibition (USI) model, where K_i is the inhibition constant describing the rate reduction.

$$v = \frac{V_{max}}{1 + \frac{K_m}{[S]} + \frac{[S]}{K_i}}$$

7.6 Glucuronide Product Analysis

A HP1050 LC system equipped with a variable wavelength UV-DAD detector was used for HPLC-UV analyses of supernatants. Agilent ChemStation software was used for instrument control and data collection. A reversed-phase 5 μm Suplex pKb-100 analytical column (0.46 cm x 25 cm, C18) was used for HPLC separations. The temperature was maintained at 25 °C. A flow rate of 1 ml/min with a linear gradient from 15-80% methanol in ammonium formate buffer (0.05 M, pH 3.4) for 25 min, followed by a linear gradient from 80-100% methanol in ammonium formate for 3 min was utilized. The elution of each metabolite of ST-12(a) was monitored at 335 nm, whereas the elution of the metabolite of ST-05 was monitored at 325 nm.

7.7 Analysis of Glucuronide Product Structures by ESI-HPLC-MS

An Acquity uHPLC system interfaced to a Quattro Premier triple quadrupole mass analyzer (Waters Corporation, Beverly, MA) with an electrospray probe operating in the positive ion mode was used for HPLC-MS analysis of the glucuronide and structural identification of glucuronide products. Liquid chromatography settings were identical to those used for LC-UV analysis, and 10 μL of sample was injected onto the column. The nitrogen flow rate was 600 L/h and was maintained at 500°C. The source temperature was 150°C.

Figure 7.2. Metabolism of **ST-12(a)** and **ST-05** with human liver microsomes. Representative HPLC analyses are shown from 60 min incubations of 50 μg of human liver proteins with 0.25 mM substrate and 3 mM UDP-GlcUA. **DNR-1** was not metabolized under the similar conditions.

7.8 Glucuronide Metabolite Analysis by HPLC–UV–VIS and HPLC–MS/MS

UGT1A and UGT2B enzymes were used for preliminary studies on the glucuronidation of **ST-05**, **DNR-1**, and **ST-12(a)**. Glucuronidation products for **ST-05** and **ST-12(a)** were detected, identified and quantitated, but no glucuronidation product of **DNR-1** was formed. Two metabolites at $t_R = 17.6$ and $t_R = 17.8$ min for **ST-12(a)** and one metabolic product at $t_R 23.2$ min for **ST-05** were identified (**Figure 7.3**).

LC– (+)-ESI–MS analysis (**Figure 5.4**), indicated that the two glucuronides of **ST-12(a)** ($t_R = 16.0$ and 16.3 min) had an $[M + \text{NH}_4]^+$ peak m/z 554, and suspected to be COO- and O-conjugated glucuronides. The enzyme β -glucuronidase selectively hydrolyzes only

O-glucuronides, and this enzyme was used to identify which of the two possible glucuronide metabolites were present. It was determined that the peak at $t_R = 16.0$ min in the HPLC chromatogram was an acyl glucuronide.

In **Figure 7.4**, ammonium adducts of **ST-05** glucuronides were not observed; however, the proton adduct $[M + H]^+$ was observed with a retention time of 23.2 min and an m/z 490. We suspected the glucuronide product to be a C=N-O-glucuronide. The different LC systems with unique system dead volumes can be attributed to the different retention times on LC-MS and LC-UV runs.

Figure 7.3. Extracted ion chromatogram (m/z 361) and (+)-ESI mass spectra of **ST-12(a)** and its glucuronide conjugate NH_4^+ adducts. Spectra of **ST-12(a)** glucuronides (two isomers of $tR = 16.0$ and 16.3 min) showed an $[\text{M} + \text{NH}_4]^+$ peak (m/z 554) plus a fragment ion resulting from neutral loss of the glucuronide moiety (m/z 361).

Figure 7.4. Structures and Mass spectra of **ST-05** and its glucuronide conjugates. Spectrum of **ST-05** glucuronide ($tR = 21.4$ min) showed an $[\text{M} + \text{H}]^+$ peak (m/z 490) plus a major peak corresponding to the **ST-05** substrate (m/z 314).

7.9 Screening of Recombinant UGTs for glucuronidation of ST-12a and ST-05.

Eight human recombinant UGT1 enzymes and UGT2B4, 2B7, 2B15, and 2B17 were acquired from BD Biosciences and were evaluated for their ability to glucuronidate **ST-12a** and **ST-05**. β -Glucuronidase hydrolysis was used to differentiate between COO- and O-glucuronides in **ST-12(a)** (**Figure 7.5**).

For **ST-12(a)**, treatment with human recombinant UGT1A3 led to both COO- and O-glucuronide formation. When UGT1A1 was utilized only the carboxyl metabolite was produced, whereas UGTs 1A7–1A10 formed only the O-glucuronide. None of the UGT2B enzymes, UGT1A4 and 1A6 were active toward this compound.

For compound **ST-05**, treatment with human recombinant UGT1A1, 1A9, and 1A10 resulted in the formation of the C=N–O-glucuronide. All of the other UGTs remained inactive.

Figure 7.5. Glucuronidation of **NI-12a** and **ST-05** by human recombinant UGTs. UGT1A1, 1A3, 1A4, 1A6, 1A7, 1A8, 1A9, 1A10, 2B4, 2B7, 2B15, 2B17 (5 μ g of protein) were evaluated for their ability to glucuronidate **DNR-1**, **ST-12(a)**, and **ST-05**. No activity was observed toward **DNR-1**, and UGT2B7, 2B4, 2B15, and 2B17 were not active toward any compound. Activities are expressed in nanomoles per milligram of protein per minute.

7.10 Glucuronidation of **ST-12(a)** and **ST-05** by Human Hepatic and Intestinal Microsomes.

Screening assays for glucuronidation activity were conducted with HLM (Human Liver Microsomes) and HIM (Human Intestine Microsomes) from 10 and 13 contributors, one pooled liver sample, and commercial hepatosomes (**Figure 7.6**). Both **ST-12(a)** and **ST-05** were shown to be glucuronidated with all the hepatic samples utilized, producing two metabolites of **ST-12(a)** and one metabolic product from **ST-05**.

Intestinal samples HI27, HI28, HI29 and HI54 failed to display glucuronidation activity toward **ST-12(a)**. Contributors HI34, HI36, HI40 and HI41 produced only the O-glucuronide. The remaining contributors with activity produced both COO- and O-glucuronide metabolites. In the case of **ST-05**, donors HI27, HI29, and HI30 did not display any glucuronidation activity, but all other donors produced the C=N-O-glucuronide.

Figure 7.6. Glucuronidation activities of Human Liver Microsomes and Human Intestinal Microsomes toward **NI-12a** and **NI-ST-05**. Human liver microsomes from 10 different donors, a pooled liver sample, and hepatosomes and human intestine microsomes from 13 different donors were analyzed. Each substrate concentration was 0.25 mM for HIM, with a molar excess of UDP-GlcUA; the reactions were incubated for 60 minutes. Activities are expressed in nmol/mg protein/min.

7.11 Kinetic Analysis of **NI-12a** and **NI-ST-05** with selected recombinant UGTs

Based on the activity screening data human recombinant UGT isoforms (UGT 1A7 to 1A10 for **ST-12(a)** and UGT1A1, 1A9, and 1A10 for **ST-05**) were subjected to kinetic analysis and the results presented in **Table 1** and **Figure 7.8,7.9** In the case of **ST-12(a)**,

human recombinant isoform UGT1A9 was the most active with $V_{\max} = 8.3 \text{ nmol/mg protein/min}$. UGT1A7 showed the greatest affinity for **ST-12(a)** with $K_m = 62 \text{ }\mu\text{M}$, and UGT1A10 had the lowest affinity with $K_m = 500 \text{ }\mu\text{M}$. Because of the high V_{\max} , the catalytic efficiency of UGT1A9 toward **ST-12(a)**, measured by the ratio V_{\max}/K_m ($35 \text{ }\mu\text{L/min/mg}$), was also the highest. Data generated for UGT1A7 and 1A8 fits an uncompetitive substrate inhibition kinetic model, which suggests the existence of multiple binding sites on these UGT isoforms.

For **ST-05**, because of the very small amount of product formation (C=N-O-glucuronidation) and the low sensitivity of our HPLC-UV/VIS detection capabilities, our ability to perform kinetic analyses was limited. Assuming Michaelis–Menten kinetics UGT1A1 activities at concentrations above $5 \text{ }\mu\text{M}$ were used to estimate a V_{\max} value of 0.2 nmol/mg/min . Cooperative binding was indicated for UGT1A10 which fit to the Hill equation. Also, data generated with isoform UGT1A9 did not fit any of the kinetic models tested.

Table 7.1. Glucuronidation Kinetics for **NI-12(a)** and **NI-ST-05** Metabolites. Glucuronidation activities of selected recombinant UGTs were measured by incubating membrane fractions with increasing concentrations of substrate (see **Figures 7.7** and **7.8**) at a constant concentration of UDP-GlcUA (3 mM). Reactions were centrifuged, supernatants separated by HPLC, and curve fits and kinetic constants determined using GraphPad Prism 4 software. *Values estimated based on an incomplete data set.

5.12 Conclusion

Figure 7.9. Glucuronidation rates of resveratrol, **ST-05** and **ST-12(a)**.

The current study was designed to test the hypothesis that the limited bioavailability of resveratrol can be improved by synthesizing analogs that will be glucuronidated at a lower rate than resveratrol itself. The analogs selected for the study: **ST-05**, **DNR-1**, and **ST-12(a)**, had aromatic hydroxylamine, hydroxyl, nitro and carboxylic acid moieties incorporated into their structures and were assumed to be less susceptible to glucuronidation, thereby improving their bioavailability. In the current study we

demonstrated that **ST-05** and **ST-12(a)** were substrates for recombinant UGT enzymes and human hepatic and intestinal microsomes. Because of the presence of sterically hindering aromatic nitro groups in the molecule, O-glucuronidation of **DNR-1** was not observed. Glucuronidation experiments with **ST-12(a)** resulted in different products and atypical reaction kinetics specific for each enzyme (Table 1), which indicates a complex mechanism of metabolism for this analog. The results from the kinetic parameters discussed earlier indicate that **ST-12(a)** will have improved bioavailability compared to that of resveratrol. Glucuronidation experiments with **ST-05** resulted in the formation of a rare C=N-O -glucuronide, and the rate of this reaction was significantly lower than that for O-glucuronidation of resveratrol.

In conclusion, the glucuronidation of the novel stilbenoids utilized in this study revealed that these compounds exhibit lower glucuronidation profiles as compared to resveratrol. Compound **ST-12(a)** and related stilbenes have been reported to be effective antitubulin agents (Borrel, Thoret et al. 2005), and based of these data, the synthesized stilbenoids likely represent a useful scaffold for the design of efficacious resveratrol analogs with improved bioavailability over resveratrol.

- Reddy, Y Thirupathi, P Raghotham Reddy, **M Nikhil Reddy**, B Rajitha and Peter A Crooks. "Sulfamic Acid: An Efficient, Cost-Effective, and Reusable Solid Acid Catalyst for the Synthesis of 1, 8-Naphthyridines under Solvent-Free Heating and Microwave Irradiation." *Synthetic Communications* 38, no. 18 (2008): 3201-3207.

Venu Madhav, J, Y Thirupathi Reddy, P Narsimha Reddy, **M Nikhil Reddy**, Suresh Kuarm, Peter A Crooks and B Rajitha. "Cellulose Sulfuric Acid: An Efficient Biodegradable and Recyclable Solid Acid Catalyst for the One-Pot Synthesis of Aryl-14h-Dibenzo [*< I> Aj</I>*] Xanthenes under Solvent-Free Conditions." *Journal of Molecular Catalysis A: Chemical* 304, no. 1 (2009): 85-87.

Narsimha R Penthala, Shobanbabu Bommagani, Venumadhav Janganati, Kenzie B. MacNicol, Chad E. Cragle, **Nikhil R. Madadi**, Linda L. Hardy, Angus M. MacNicol, and Peter A. Crooks. Synthesis of C-C bond analogs of parthenolide and melampomagnolide B as anticancer modulators that modify cell cycle progression. *European Journal of Medicinal Chemistry*. **Accepted (*In press*) (2014)**.

Nikhil Reedy Madadi, Hongliang Zong, Amit Ketkar, Chen Zheng, Narsimha Reddy Penthala, Venumadhav Janganati, Shobanbabu Bommagani, Robert Eoff, Monica L. Guzman, Peter A. Crooks. Synthesis and evaluation of a series of combretastatin/resveratrol analogs as anti-cancer agents. *MedChemComm*. ***Ready for submission***.

Narsimha Reddy Penthala, **Nikhil Reddy Madadi**, Janganati, Venumadhav and Peter A Crooks. L-Proline catalyzed one-step synthesis of 4,5-diaryl-2*H*-1,2,3-triazoles from cyanostilbenes via [3+2] cycloaddition of azide. *Tetrahedron Letters*. **Accepted (*In press*) (2014)**.

4,5 disubstituted-2*H*-1,2,3-triazoles as potent and stable combretastatin A4 analogues. ***In preparation***

3,4-(methylenedioxy)-substituted cyanostilbenes as selective and high affinity ligands for CB1 and CB2 cannabinoid receptors. ***In preparation***

PATENTS

- **M. Nikhil Reddy**, P. Narsimha Reddy, Peter A. Crooks, M. Leena and E. Robert. 4,5-Disubstituted-2*H*-1,2,3-triazoles as anticancer agents, US Provisional Patent Application No. 61/972,938, submitted on March 10th, (2014).
- Peter A. Crooks, Y. Thirupathi Reddy, P. Narsimha Reddy, **M. Nikhil Reddy**, and B. Rajitha. Process Development for the Synthesis of Bupropion Hydrochloride and Hydroxybupropion *via* Efficient Bromination using *N*-Bromosuccinimide, US Provisional Patent Application No. 61/198,802, submitted on November 10th, (2009).
